The Google Professional-Cloud-Architect web-based practice exam software can be easily accessed through browsers like Safari, Google Chrome, and Firefox. The customers do not need to download or install excessive software or applications to take the Google Certified Professional - Cloud Architect (GCP) (Professional-Cloud-Architect) web-based practice exam. The Professional-Cloud-Architect web-based practice exam software format can be accessed through any operating system like Windows or Mac.

Google Certified Professional - Cloud Architect (GCP) Sample Questions (Q105-Q110):

NEW QUESTION # 105

Your customer is moving an existing corporate application to Google Cloud Platform from an on- premises data center. The business owners require minimal user disruption. There are strict security team requirements for storing passwords. What authentication strategy should they use?

- A. Federate authentication via SAML 2.0 to the existing Identity Provider.
- B. Ask users to set their Google password to match their corporate password.

- C. Provision users in Google using the Google Cloud Directory Sync tool.
- D. Use G Suite Password Sync to replicate passwords into Google.

Answer: C

Explanation:

Provision users to Google's directory

The global Directory is available to both Cloud Platform and G Suite resources and can be provisioned by a number of means.

Provisioned users can take advantage of rich authentication features including single sign-on (SSO), OAuth, and two-factor verification.

You can provision users automatically using one of the following tools and services:

Google Cloud Directory Sync (GCDS)

Google Admin SDK

A third-party connector

GCDS is a connector that can provision users and groups on your behalf for both Cloud Platform and G Suite. Using GCDS, you can automate the addition, modification, and deletion of users, groups, and non-employee contacts. You can synchronize the data from your LDAP directory server to your Cloud Platform domain by using LDAP queries. This synchronization is one-way: the data in your LDAP directory server is never modified.

NEW QUESTION # 106

A news feed web service has the following code running on Google App Engine. During peak load, users report that they can see news articles they already viewed.

What is the most likely cause of this problem?

```
import news
from flask import Flask, redirect, request
from flask.ext.api import status
from google.appengine.api import users

app = Flask(__name__)
sessions = {}

@app.route("/")
def homepage():
    user = users.get_current_user()
    if not user:
        return "Invalid login",
        status.HTTP_401_UNAUTHORIZED

    if user not in sessions:
        sessions[user] = {"viewed": []}

    news_articles = news.get_new_news (user, sessions [user]
["viewed"])
    sessions [user] ["viewed"] += [n["id"] for n
in news_articles]

    return news.render (news_articles)

if __name__ == "__main__":
    app.run ()
```

- A. The session variable is being overwritten in Cloud Datastore.
- B. The HTTP Expires header needs to be set to -1 to stop caching.
- C. The session variable is local to just a single instance.
- D. The URL of the API needs to be modified to prevent caching.

Answer: A

Explanation:

<https://stackoverflow.com/questions/3164280/google-app-engine-cache-list-in-session-variable?rq=1>

NEW QUESTION # 107

Your organization has a 3-tier web application deployed in the same network on Google Cloud Platform. Each tier (web, API, and database) scales independently of the others. Network traffic should flow through the web to the API tier and then on to the database tier.

Traffic should not flow between the web and the database tier. How should you configure the network?

- A. Set up software based firewalls on individual VMs.
- B. Add tags to each tier and set up routes to allow the desired traffic flow.
- C. Add each tier to a different subnetwork.
- **D. Add tags to each tier and set up firewall rules to allow the desired traffic flow.**

Answer: D

NEW QUESTION # 108

Your customer wants to do resilience testing of their authentication layer. This consists of a regional managed instance group serving a public REST API that reads from and writes to a Cloud SQL instance.

What should you do?

- **A. Schedule a disaster simulation exercise during which you can shut off all VMs in a zone to see how your application behaves.**
- B. Configure a read replica for your Cloud SQL instance in a different zone than the master, and then manually trigger a failover while monitoring KPIs for your REST API.
- C. Deploy intrusion detection software to your virtual machines to detect and log unauthorized access.
- D. Engage with a security company to run web scrapes that look for your users' authentication data on malicious websites and notify you if any is found.

Answer: A

NEW QUESTION # 109

You are monitoring Google Kubernetes Engine (GKE) clusters in a Cloud Monitoring workspace. As a Site Reliability Engineer (SRE), you need to triage incidents quickly. What should you do?

- A. Create a custom dashboard in the Cloud Monitoring workspace for each incident, and then add metrics and create alert policies.
- B. Navigate the predefined dashboards in the Cloud Monitoring workspace, create custom metrics, and install alerting software on a Compute Engine instance.
- **C. Navigate the predefined dashboards in the Cloud Monitoring workspace, and then add metrics and create alert policies.**
- D. Write a shell script that gathers metrics from GKE nodes, publish these metrics to a Pub/Sub topic, export the data to BigQuery, and make a Data Studio dashboard.

Answer: C
