CompTIA PenTest+ Certification Sample Questions (Q78-Q83):

NEW QUESTION # 78

Performing a penetration test against an environment with SCADA devices brings additional safety risk because the:

- A. devices may cause physical world effects.
- B. devices are obsolete and are no longer available for replacement.
- C. devices produce more heat and consume more power.
- D. protocols are more difficult to understand.

Answer: A

Explanation:

"A significant issue identified by Wiberg is that using active network scanners, such as Nmap, presents a weakness when attempting port recognition or service detection on SCADA devices. Wiberg states that active tools such as Nmap can use unusual TCP segment data to try and find available ports. Furthermore, they can open a massive amount of connections with a specific SCADA device but then fail to close them gracefully." And since SCADA and ICS devices are designed and implemented with little attention having been paid to the operational security of these devices and their ability to handle errors or unexpected events, the presence of idle open connections may result in errors that cannot be handled by the devices.

NEW QUESTION # 79

Which of the following can be used to store alphanumeric data that can be fed into scripts or programs as input to penetration-testing tools?

- A. Directory
- B. Symlink
- **C. Dictionary**
- D. Catalog
- E. For-loop

Answer: C

Explanation:

Explanation

A dictionary can be used to store alphanumeric data that can be fed into scripts or programs as input to penetration-testing tools. A dictionary is a collection of key-value pairs that can be accessed by using the keys.

For example, a dictionary can store usernames and passwords, or IP addresses and hostnames, that can be used as input for brute-force or reconnaissance tools.

NEW QUESTION # 80

As part of active reconnaissance, penetration testers need to determine whether a protection mechanism is in place to safeguard the target's website against web application attacks. Which of the following methods would be the most suitable?

- A. Antivirus scanning
- B. Scapy packet crafting
- C. Direct-to-origin testing
- **D. WAF detection**

Answer: D

Explanation:

Detecting a Web Application Firewall (WAF) helps penetration testers understand the protective measures in place and tailor their testing methods to bypass these defenses.

Details:

- * A. Direct-to-origin testing: Useful for bypassing CDN but not specifically for detecting protective mechanisms like WAF.
- * B. Antivirus scanning: Not relevant for web application attacks.
- * C. Scapy packet crafting: Useful for network-level testing but not for detecting web application protections.
- * D. WAF detection: Identifies if a WAF is present, which is critical for understanding and bypassing web application defenses.

References: WAF detection techniques are documented in web application security testing methodologies such as OWASP.

NEW QUESTION # 81

A penetration tester runs the following command on a system:

```
find / -user root -perm -4000 -print 2>/dev/null
```

Which of the following is the tester trying to accomplish?

- **A. Find files with the SUID bit set**
- B. Find files that were created during exploitation and move them to /dev/null
- C. Set the SGID on all files in the / directory

- D. Find the /root directory on the system

Answer: A

Explanation:

the 2>/dev/null is output redirection, it simply sends all the error messages to infinity and beyond preventing any error messages to appear in the terminal session.

The tester is trying to find files with the SUID bit set on the system. The SUID (set user ID) bit is a special permission that allows a file to be executed with the privileges of the file owner, regardless of who runs it. This can be used to perform privileged operations or access restricted resources. A penetration tester can use the find command with the -user and -perm options to search for files owned by a specific user (such as root) and having a specific permission (such as 4000, which indicates the SUID bit is set).

NEW QUESTION # 82

A penetration tester was hired to test Wi-Fi equipment. Which of the following tools should be used to gather information about the wireless network?

- A. WHOIS
- **B. Kismet**
- C. BeEF
- D. Burp Suite

Answer: B

Explanation:

Kismet is a well-known tool used in penetration testing for wireless network detection, packet sniffing, and intrusion detection. It is particularly useful for gathering information about Wi-Fi networks as it can detect hidden networks and capture network packets. This capability allows penetration testers to analyze the wireless environment, identify potential vulnerabilities, and assess the security posture of the Wi-Fi equipment being tested. Unlike the other tools listed, Kismet is specifically designed for wireless network analysis, making it the ideal choice for this task.
