Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q65-Q70):

NEW QUESTION # 65

When is a volume considered "Public"?

- A. When the volume does not have any ownership associated with it
- **B. When guest access is enabled**
- C. When a volume is owned by system.admin

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Portworx, a volume is considered "Public" when guest access is enabled. Guest access allows users and applications without explicit Portworx authentication credentials to access the volume. This setting is typically used in less restrictive environments where access control is relaxed, but it reduces security by exposing data to potentially unauthorized entities. Public volumes can be accessed by any entity with network connectivity and basic permissions, which is why enabling guest access is carefully controlled in secure deployments. Portworx documentation on security models and access controls stresses that public volumes should be used sparingly and monitored closely due to the elevated risk of data exposure and compliance violations 【Pure Storage Portworx Security Guide source】.

NEW QUESTION # 66

What are the three severity levels for Portworx alerts?

- A. INFO, WARNING, ALARM
- B. INFO, WARNING, ERROR
- **C. INFO, WARNING, CRITICAL**

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx classifies alerts into three main severity levels to help administrators prioritize response actions. These levels are INFO, WARNING, and CRITICAL. INFO alerts provide informational messages about non-critical events, such as configuration changes or normal operational milestones. WARNING alerts indicate potential issues that could impact performance or availability if left unaddressed, such as increased latency or approaching capacity limits. CRITICAL alerts signal severe problems requiring immediate attention, such as node failures or data corruption risks. This severity categorization supports effective alert management and escalation policies, allowing operational teams to focus on high-impact issues first. The Portworx observability and alerting guide explains these levels in detail and recommends integrating alerts with external monitoring systems for centralized management 【Pure Storage Portworx Alerting Guide source】.

NEW QUESTION # 67

Which Portworx component is used to co-locate volumes with pods?

- **A. Volume Placement Strategy**
- B. Autopilot
- C. Stork

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx's Volume Placement Strategy ensures that persistent volumes are co-located with the pods that use them, enhancing performance and reducing latency. This strategy involves applying placement rules and constraints that guide Kubernetes scheduler

and Portworx storage operations to place data volumes on nodes close to or the same as the pods. Co-location improves I/O throughput and application responsiveness by minimizing network hops between compute and storage resources. While Autopilot automates scaling and Stork manages storage-aware scheduling, Volume Placement Strategy specifically handles volume location relative to workloads. The Portworx architecture documentation highlights this component as critical for optimizing storage efficiency and workload performance in Kubernetes environments running Portworx storage [【Pure Storage Portworx Architecture Docs source】](#) .

NEW QUESTION # 68

A Portworx administrator wants to control which nodes will host a KVDB installation.

What steps must an administrator take to ensure that KVDB installs on NODE01, NODE03, and NODE05?

- A. It is not possible to configure the location of the KVDB prior to installation.
- **B. Change the following in the 'StorageCluster' spec prior to installation:**
spec:
kvdb:
selector:
matchNodeName:
- NODE01
- NODE03
- NODE05
- C. Label NODE01, NODE03, and NODE05 with 'pxl/metadata-node=true' prior to installation.

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx provides a mechanism to control KVDB pod placement through the kvdb.selector.matchNodeName field in the StorageCluster Custom Resource Definition (CRD). This allows administrators to explicitly specify node names where KVDB pods will be deployed. By setting this selector to include NODE01, NODE03, and NODE05, KVDB pods will run exclusively on these nodes, ensuring better control of quorum, fault tolerance, and performance. Node labeling alone is insufficient unless the labels are properly referenced in the spec, making direct node name matching the most straightforward and reliable method. This configuration must be done prior to cluster installation to ensure proper pod placement. Official Portworx documentation on cluster deployment and KVDB configuration confirms this method as the recommended best practice for managing KVDB nodes, critical for maintaining database availability and consistency within the Portworx cluster [【Pure Storage Portworx Install Guide source】](#) .

NEW QUESTION # 69

What is the recommended practice for managing the lifecycle of snapshots in Portworx?

- **A. Configure the retention policies.**
- B. Manually delete old snapshots to free up space.
- C. Retain all snapshots indefinitely.

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The recommended approach to managing Portworx snapshots is to configure retention policies that automatically govern the lifecycle of snapshots, including their expiration and deletion. These policies ensure that snapshots are retained only as long as needed, preventing uncontrolled accumulation that can consume excessive storage and degrade performance. By setting retention rules, administrators can automate snapshot cleanup, enforce compliance requirements, and optimize resource usage. Manual deletion is error-prone and inefficient at scale, and retaining all snapshots indefinitely can lead to capacity exhaustion and management challenges. Portworx documentation provides detailed guidance on defining snapshot retention schedules, including time-based expiration and count limits, enabling administrators to maintain a balance between data protection and storage efficiency [【Pure Storage Portworx Snapshot Management Guide source】](#) .
