ISTQB Certified Tester Advanced Level - Test Manager Sample Questions (Q83-Q88):

NEW QUESTION # 83

Given is the following defect removal chart reported at the end of system testing - showing total defects detected and closed defects (fixed and successfully retested). A number of open defects are classified as critical. All tests have been executed.

Based on the chart above, what is the most appropriate next test phase? 1 credit

- A. Acceptance testing to verify the business process
- **B. Another system test cycle to verify defect resolution**
- C. Acceptance testing to verify operational requirements
- D. Requirements testing as part of testing regulatory compliance

Answer: B

NEW QUESTION # 84

Which of the following is a benefit of independent testing? 1 credit

- **A. Independent testers find different defects and are unbiased.**
- B. Testing is isolated from development.

- C. Developers do not have to take as much responsibility for quality.
- D. Code cannot be released into production until independent testing is complete.

Answer: A

Explanation:

Explanation:

Topic 8, Scenario 8, V2 'Test Process Improvement'

You have raised the issue that improving the testing process is also dependent on the status of the software development process.

NEW QUESTION # 85

Your team has been assigned to a new project. You have a mix of manual testers and automation engineers but everyone is currently doing manual testing. The development team has already decided to use DevOps as its approach but they have never used it before and are happy to take your input. Unfortunately, about 50% of the development is completed already. In the testing your team is doing they are finding that about 40% of the defects they catch are actually regressions caused by other changes. Given this information, what should you do to help mitigate risk?

- A. Review the policies regarding defect reporting and ensure your team is adding all the necessary information to each defect report
- B. Optimize the test environment to provide faster testing with more accurate test data and better testing tools to provide wider coverage
- C. Pivot part of the team from manual testing to test automation development to address the regression risk and implement better quality gates to reduce regressions
- D. Implement code reviews for the development team and require tester signoff before code can be released into the pipeline

Answer: C

Explanation:

Identifying the Risk:

High regression rates (40%) indicate a need to improve regression testing capabilities and reduce risks.

Test automation addresses regressions effectively by enabling faster and repeated testing.

Evaluation of Options:

A is irrelevant to the regression risks highlighted.

B is correct because it emphasizes test automation for regressions and quality gates to prevent defect leaks.

C is partially valid but does not directly address regression issues.

D focuses on development practices, which, while helpful, does not directly reduce regression risks.

Reference and Syllabus Alignment:

This aligns with ISTQB guidelines on balancing manual and automated testing in regression scenarios (TM-1.6.3, TM-1.4.2).

NEW QUESTION # 86

Which one of the following estimation approaches is appropriate at this stage of the project? 2 credits

- A. Create an estimate based on a percentage of the development effort
- B. Create an estimate based on the function point analysis technique and test point analysis
- C. Create an estimate based on the complexity of the code
- D. Create an estimate based on the credentials of the successful bidder

Answer: B

NEW QUESTION # 87

Test results are reported as "Requirements tested, passed, and failed".

What test strategy are you using? [1]

- A. Exploratory
- B. Model-based
- C. Analytical
- D. Reactive

Answer: C

Explanation:

An analytical test strategy is a test strategy that is based on the analysis of the factors that affect the quality of the software under test, such as the requirements, the risks, the complexity, or the criticality¹. An analytical test strategy uses these factors to define the test objectives, scope, approach, and techniques, as well as to prioritize and allocate the test resources². Reporting the test results as "Requirements tested, passed, and failed" implies that the testing is driven by the requirements, which are the specifications of the desired features and functions of the software under test. Testing based on the requirements is an example of an analytical test strategy, as it uses the requirements as the main factor to guide the testing activities. Therefore, option C is the correct answer.

Option A is incorrect because a model-based test strategy is a test strategy that uses models to represent the desired behavior and structure of the software under test, and to derive test cases, test data, test procedures, and test oracles. A model-based test strategy does not necessarily report the test results as "Requirements tested, passed, and failed", as it may use other types of models, such as state diagrams, data flow diagrams, or decision tables, to generate and execute the tests. Option B is incorrect because an exploratory test strategy is a test strategy that uses the tester's knowledge, skills, and creativity to design and execute tests dynamically, without predefined test cases or test procedures. An exploratory test strategy does not report the test results as "Requirements tested, passed, and failed", as it does not follow a formal or structured testing process, but rather relies on the tester's intuition, experience, and feedback.

Option D is incorrect because a reactive test strategy is a test strategy that uses the actual behavior and results of the software under test to design and execute tests, without prior knowledge or documentation of the software. A reactive test strategy does not report the test results as "Requirements tested, passed, and failed", as it does not have any requirements or specifications to compare the software against, but rather uses the software itself as the test basis.
