Fortinet NSE 6 - FortiSwitch 7.2 Sample Questions (Q27-Q32):

NEW QUESTION # 27

To enhance service in emergency situations, to which LLDP-MED Type-Length-Values does Forti-Switch advertise to IP phones?

- A. Inventory management
- **B. Location**
- C. Power management

- D. Network policy

Answer: B

Explanation:

Location (C): FortiSwitch uses LLDP-MED (Link Layer Discovery Protocol - Media Endpoint Discovery) to advertise various attributes to IP phones, among which "Location" is crucial in emergency situations. This information helps emergency responders to determine the physical location of the calling device, which is vital for prompt response in critical situations.

NEW QUESTION # 28

Refer to the exhibit.

Core-1 and Access-1 are managed and authorized by FortiGate-1, which uses port4 as the FortiLink interface. After FortiGate authorizes and manages Core-2, Port1 status becomes STP discarding.

Why is port1 in the discarding state?

- A. Core-2 has the lowest bridge priority.
- B. Access-1 is the root bridge and can only have one root port.
- C. port1 on Core-2 is discarding only management traffic.
- **D. Core-1 and Core-2 do not have MCLAG configuration.**

Answer: D

Explanation:

The STP (Spanning Tree Protocol) discarding state on port1 of Core-2, after Core-1 and Access-1 are managed and authorized by FortiGate-1, is likely due to the lack of an MCLAG (Multi-Chassis Link Aggregation Group) configuration between Core-1 and Core-2. In typical network configurations involving STP and MCLAG, the absence of MCLAG can lead to STP blocking one of the redundant paths to prevent loops, which is a critical function of STP. Port1 on Core-2 being in a discarding state suggests that it has been identified as providing a redundant path that could potentially create a network loop, hence STP has placed this port in a blocking (discarding) state to maintain a loop-free topology.

NEW QUESTION # 29

Refer to the exhibit.

Core-1 and Access-1 are managed and authorized by FortiGate-1, which uses port4 as the FortiLink interface. After FortiGate authorizes and manages Core-2, Port1 status becomes STP discarding. Why is port1 in the discarding state?

- A. Core-2 has the lowest bridge priority.
- B. Access-1 is the root bridge and can only have one root port.
- C. port1 on Core-2 is discarding only management traffic.
- **D. Core-1 and Core-2 do not have MCLAG configuration.**

Answer: D

NEW QUESTION # 30

Exhibit.

LAG and MCLAG are used to increase the available network bandwidth and enable redundancy. How does spanning tree protocol see MCLAG and LAG if they are configured based on the physical view shown in the exhibit? (Choose two)

- A. Switch 3 and Switch 4 uplinks are treated as single interfaces.
- **B. Switch 1 and Switch 2 both seen as one single switch.**
- **C. Switch 3 and switch 4 are seen as one MCLAG switch client**
- D. Switch 1, Switch 2, and Switch 3 are seen as one MCLAG peer group

Answer: B,C

NEW QUESTION # 31

Exhibit.

Port Mode	Enabled Features	Native VLAN	Allowed VLANs	Port	Device Information	Discov Snapping
Edge Port	Spanning Tree Protocol	default	all	Power	02:00:0c:1a:00:06	Untrusted
Edge Port	Spanning Tree Protocol	default	all	Power	5c:85:7e:32:1a:e2	Untrusted
Edge Port	Spanning Tree Protocol	100	all	Power		

The exhibit shows the current status of the ports on the managed FortiSwitch.

Access-1.

Why would FortiGate display a serial number in the Native VLAN column associated with the port23 entry?

- A. Port23 is configured as the dedicated management interface.
- B. Port23 is a member of a trunk that uses the Access-1 FortiSwitch serial number as the name of the trunk.
- **C. A standalone switch with the shown serial number is connected on port23.**
- D. Ports connect to adjacent FortiSwitch devices will show their serial number as the native VLAN

Answer: C

Explanation:

The appearance of a serial number in the Native VLAN column for port23 suggests that the switch connected to this port is identified uniquely in the network. Given the options provided:

A standalone switch with the shown serial number is connected on port23 (Option C): This is the most plausible explanation. The FortiSwitch configuration interface is displaying the serial number of a standalone switch that is directly connected to port23. This

kind of display helps in identifying and managing individual devices in a network setup, especially in environments with multiple switches.
