We will try our best to solve your problems for you. I believe that you will be more inclined to choose a good service product, such as MuleSoft-Integration-Associate learning question. After all, everyone wants to be treated warmly and kindly, and hope to learn in a more pleasant mood. The authoritative, efficient, and thoughtful service of MuleSoft-Integration-Associate learning question will give you the best user experience, and you can also get what you want with our MuleSoft-Integration-Associate study materials. I hope our study materials can accompany you to pursue your dreams. If you can choose MuleSoft-Integration-Associate test guide, we will be very happy. We look forward to meeting you.

Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q20-Q25):

NEW QUESTION # 20

An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process. It created an order processing API that coordinates stateful interactions with a variety of microservices that validate, create and fulfill new product orders.

Which interaction composition pattern did the integration architect who designed this order processing API use?

- A. Aggregation
- B. Multicasting
- **C. Orchestration**
- D. Streaming

Answer: C

Explanation:

In an API-led connectivity approach, different APIs are layered to provide modular and reusable services. For an order processing API that coordinates stateful interactions with various microservices, the integration architect used the orchestration interaction composition pattern. Here's a step-by-step explanation:

* Understanding Orchestration:

* Definition: Orchestration involves coordinating multiple services to achieve a complex business workflow. Unlike choreography, which relies on each service knowing its part, orchestration uses a central controller to manage the interactions.

* Role of the Orchestrator: The orchestrator manages the execution sequence, handles the state, and ensures all the necessary steps are completed successfully.

* Order Processing API:

* API-Led Connectivity: An order processing API, following API-led connectivity, sits in the Process layer, handling complex business processes and logic.

* Stateful Interactions: Orchestration is particularly suitable for stateful interactions where the process needs to remember the state between steps, such as validating an order, creating it, and fulfilling it.

* Implementation Steps:

* Microservices Interaction: The order processing API interacts with various microservices:

* Validation Microservice: Checks the validity of the order details.

* Creation Microservice: Creates the order in the system.

* Fulfillment Microservice: Manages the order fulfillment process.

* Coordination: The API orchestrates these steps, ensuring each one completes successfully before moving to the next, handling exceptions, and maintaining the state of the process.

NEW QUESTION # 21

Which AnypointPlatform component helps integration developers discover and share reusable APIs, connectors and templates'?

- A. API Manager
- B. Anypoint Studio
- **C. Anypoint Exchange**
- D. Design Center

Answer: C

Explanation:

Anypoint Exchange is a component of the Anypoint Platform that helps integration developers discover and share reusable APIs, connectors, and templates. Here's a detailed explanation:

* Anypoint Exchange:

* Purpose: Acts as a centralized repository for discovering, sharing, and reusing APIs, connectors, templates, and other integration assets.

* Discovery: Developers can search for and find existing APIs, connectors, and templates within the organization or from the wider MuleSoft community.

* Sharing: Allows developers to publish their APIs and assets, making them available for reuse by others in the organization.

* Benefits:

* Reusability: Promotes reuse of existing assets, reducing development time and effort.

* Collaboration: Facilitates collaboration and sharing of best practices among development teams.

* Documentation: Provides comprehensive documentation and usage examples for each asset.

NEW QUESTION # 22

An integration architect is designing an API that must accept requests from API clients for both XML and JSON content over HTTP/1.1 by default.

Which API architectural style when used for its intended and typical purposes, should the architect choose to meet these requirements?

- A. gRPC
- **B. REST**
- C. SOAP
- D. GraphQL

Answer: B

Explanation:

REST (Representational State Transfer) is an architectural style commonly used for designing networked applications, particularly APIs that need to handle multiple content types over HTTP. Here's a detailed explanation:

* Content Negotiation:

* Definition: REST APIs support content negotiation, allowing clients to request either XML or JSON formats by setting the `Accept` header in HTTP requests.

* Flexibility: This capability makes REST ideal for scenarios where an API needs to serve multiple content types.

* HTTP Protocol:

* Usage: REST APIs operate over HTTP/1.1, making them compatible with web standards and easily accessible by various clients (browsers, mobile apps, etc.).

* Methods: Supports standard HTTP methods like GET, POST, PUT, DELETE, allowing for CRUD operations.

* Advantages:

* Stateless: Each request from a client to server must contain all the information needed to understand and process the request.

* Scalability: RESTful services can handle a high load of requests efficiently.

NEW QUESTION # 23

According to MuleSoft which principle is common to both Service Oriented Architecture (SOA) and API-led connectivity approaches*?

- **A. Service reusability**
- B. Service centralization
- C. Service statefulness
- D. Service interdependence

Answer: A

Explanation:

Both Service-Oriented Architecture (SOA) and API-led connectivity emphasize the principle of service reusability. Here's a detailed explanation:

* Service Reusability:

* Definition: Service reusability is the principle where services are designed to be reusable across different applications and use cases.

* SOA: In SOA, services are modular components that can be reused in various business processes, reducing redundancy and promoting efficient service composition.

* API-led Connectivity: This approach also stresses creating reusable APIs (System APIs, Process APIs, Experience APIs) that can be leveraged across multiple projects and applications.

* Benefits:

* Efficiency: Reduces development time and effort by reusing existing services.

* Consistency: Ensures consistency in business logic and data access across different applications.

* Scalability: Facilitates scaling by using standardized and reusable services/APIs.

NEW QUESTION # 24

According to the National Institute of Standards and Technology (NIST) which cloud computing deployment model describes a composition of two or more distinct clouds that support data and application portability?

- A. Public cloud
- B. Private cloud
- C. Hybrid cloud
- D. Community cloud

Answer: C

Explanation:

According to the National Institute of Standards and Technology (NIST), a hybrid cloud is a cloud computing deployment model that consists of a combination of two or more distinct cloud infrastructures (private, community, or public) that remain unique entities but are bound together by standardized or proprietary technology that enables data and application portability. Here's a detailed explanation:

* Hybrid Cloud:

* Definition: Combines on-premises infrastructure (private cloud) with public cloud services, allowing data and applications to be shared between them.

* Portability: Ensures seamless data and application movement between the private and public clouds.

* Integration: Uses technology such as VPNs, APIs, or hybrid cloud management tools to integrate the environments.

* Benefits:

* Flexibility: Offers greater flexibility in deploying workloads where they are most appropriate.

* Scalability: Provides scalability by leveraging public cloud resources while maintaining control over critical applications in a private cloud.

* Cost Efficiency: Optimizes costs by utilizing public cloud resources for less sensitive workloads while keeping sensitive data in a private cloud.
