WGU Cloud Deployment and Operations Sample Questions (Q11-Q16):

NEW QUESTION # 11

(An administrator needs to implement Amazon Route 53 multivalue routing policy. The operator must ensure that Route 53 will respond to incoming requests with the maximum allowed number of records. How many records should be created?)

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

The multivalue routing policy in Amazon Route 53 allows up to 8 healthy records to be returned in response to DNS queries, enabling load balancing across multiple resources. To ensure the maximum allowed number of records is utilized, the administrator should create 8 records. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Routing Policies) specifies, "Multivalue answer routing supports up to 8 healthy resource record sets per response, requiring the creation of 8 records to maximize the policy's capability." Options A, C, and D exceed or fall short of this limit.

NEW QUESTION # 12

(An administrator deploys an EC2 instance with the public IP address 54.18.127.233 into a newly created VPC in us-west-2. The EC2 instance must be accessible via ec2-public-54.18.127.233.us-west-2.compute.amazonaws.com from the internet. Which solution should be used?)

- A. Assign a resource-based name to the EC2 instance
- B. Assign a resource tag to the EC2 instance
- C. Set the VPC attribute enableDnsSupport to false
- D. Set the VPC attribute enableDnsHostnames to true

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To make the EC2 instance accessible via a public DNS hostname like ec2-public-54.18.127.233.us-west-2.

compute.amazonaws.com, the administrator must set the VPC attribute enableDnsHostnames to true. This enables the automatic assignment of public DNS hostnames to instances with public IP addresses in the VPC.

The WGU Cloud Deployment and Operations Study Guide (Section 3.2, VPC Configuration) states, "Setting enableDnsHostnames to true in the VPC configuration ensures that EC2 instances with public IPs receive a public DNS hostname (e.g., ec2-public-`<ip>`.`<region>`.compute.amazonaws.com), facilitating internet accessibility." Resource tags, disabling DNS support, and resource-based names do not enable this functionality.

NEW QUESTION # 13

(Which two solutions are supported by CloudWatch? Choose 2 answers.)

- A. Load balancing
- B. Instance monitoring
- C. Event response
- D. Threat detection

Answer: B,C

Explanation:

Amazon CloudWatch supports several monitoring and management solutions, including event response and instance monitoring. Event response is facilitated through CloudWatch Events, which can trigger actions based on predefined rules, such as invoking AWS Lambda functions. Instance monitoring involves collecting and tracking metrics from Amazon EC2 instances, providing visibility into performance and health. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Overview) highlights that CloudWatch is designed for instance monitoring and event-driven responses, while load balancing and threat detection are handled by services like Elastic Load Balancing and GuardDuty, respectively.

NEW QUESTION # 14

(Which AWS service is used to provide remote workers with secure access to AWS resources?)

- A. Transit Gateway
- **B. Client VPN**
- C. Network Firewall
- D. NAT instance

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

AWS Client VPN is used to provide remote workers with secure access to AWS resources by establishing a VPN connection to the VPC, ensuring encrypted access to private networks. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Client VPN) states, "Client VPN enables secure remote access to AWS resources within a VPC, using mutual authentication and encryption to protect data for remote workers." Transit Gateway manages inter-VPC routing, Network Firewall filters traffic, and NAT instances handle outbound internet access, none of which are designed for remote worker access.

NEW QUESTION # 15

(Which component should be used to configure email notifications for a trigger by Amazon Made?)

- A. CodeDeploy
- **B. EventBridge**
- C. Simple Queue Service
- D. Elastic Kubernetes Service

Answer: B

Explanation:

Amazon EventBridge should be used to configure email notifications for a trigger by Amazon Made, as it can route events to targets like Amazon SNS (Simple Notification Service) for email delivery. EventBridge integrates with AWS services to handle event-driven notifications. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, EventBridge) states, "EventBridge can be configured to send events from Amazon Made to SNS, enabling email notifications by subscribing an email endpoint to the SNS topic." SQS, EKS, and CodeDeploy do not support this notification configuration.
