ISTQB Certified Tester - Performance Testing Sample Questions (Q14-Q19):

NEW QUESTION # 14

Which type of performance test measures the system's ability to handle increasing levels of load?

- A. Spike testing
- B. Elevation testing
- C. Load testing
- D. Endurance testing

Answer: C

Explanation:

Load testing assesses a system's ability to handle gradually increasing levels of load and ensures that it meets performance expectations under normal and peak conditions.

Option B (Elevation testing) is incorrect because this term does not exist in ISTQB performance testing terminology.

Option C (Spike testing) focuses on sudden increases in load rather than gradual scaling.

Option D (Endurance testing) examines how a system performs over an extended period, rather than gradual load increases.

NEW QUESTION # 15

At what point during performance testing does monitoring with the load testing tool begin?

- **A. Simultaneously with test execution.**
- B. Before testing execution.
- C. When testing is concluded.
- D. Immediately after test execution.

Answer: A

Explanation:

Performance monitoring must begin simultaneously with test execution to capture system behavior in real-time. This ensures that bottlenecks and performance issues are identified immediately.

Option A (After testing is concluded) is incorrect because historical monitoring does not help in real-time analysis.

Option B (Before execution) is incorrect because monitoring needs active system load to measure performance.

Option C (Immediately after execution) is incorrect because it misses runtime metrics.

NEW QUESTION # 16

What is an advantage of aggregating the results of performance testing?

- **A. It is easier for stakeholders to draw a correct conclusion from aggregated results.**
- B. Testing is expedited when the results are aggregated.
- C. Aggregated results provide more detail and allow for a more complete analysis of the test.
- D. Aggregated results show when testing has been completed.

Answer: A

Explanation:

Aggregating test results helps stakeholders understand performance trends by combining data points from multiple test runs. This makes it easier to draw conclusions about system behavior.

Option A is incorrect because aggregation may reduce detailed visibility, not increase it.

Option B is incorrect because aggregation does not expedite testing itself.

Option D is incorrect because aggregated results do not indicate test completion.

NEW QUESTION # 17

Why is it important to specify how failures are handled during test execution?

- A. To minimize distractions during testing
- **B. To ensure that new failures are not introduced**
- C. To meet the expectations of the business stakeholders
- D. To ensure all defects are captured

Answer: B

Explanation:

During performance testing, it is crucial to define failure handling procedures to ensure that failures do not introduce additional errors into the test execution process. This helps maintain test accuracy and avoid misleading results.

Option A (Meeting stakeholder expectations) is important but not the primary reason for defining failure handling.

Option C (Capturing all defects) is a general testing principle, not specific to failure handling in performance tests.

Option D (Minimizing distractions) is not a valid reason for defining failure handling.

NEW QUESTION # 18

What is the primary purpose of a load generator?

- A. Record and analyze the behavior of the system as it is executing the prescribed tests
- B. Create a steady and consistent background load on the system
- C. Support root cause analysis when performance degradation is encountered
- **D. Simulate user behavior in accordance with the defined operational profile**

Answer: D

Explanation:

A load generator is responsible for simulating virtual users and applying workloads to a system as defined by an operational profile. This allows testers to analyze how the system behaves under different load conditions.

Option A (Background load) is incorrect because load generators create simulated user interactions, not just background noise.

Option C (Record and analyze behavior) is the role of monitoring tools, not a load generator.

Option D (Support root cause analysis) is incorrect because root cause analysis is done after the load test, using monitoring tools.
