## Quiz 2025 VMCE\_v12: Veeam Certified Engineer v12 Marvelous Detailed Study Plan

Do you worry about not having a long-term fixed study time? Do you worry about not having a reasonable plan for yourself? VMCE\_v12 exam dumps will solve this problem for you. Based on your situation, including the available time, your current level of knowledge, our study materials will develop appropriate plans and learning materials. Whatever you want to choose, you want to learn from which stage. In our study materials, you can find the right one for you. At the same time, the VMCE\_v12 Exam Prep is constantly updated. After you have finished learning a part, you can choose a new method according to your own situation. Our study materials are so easy to understand that no matter who you are, you can find what you want here.

### Veeam Certified Engineer v12 Sample Questions (Q61-Q66):

#### NEW QUESTION # 61

A Veeam proxy server is configured as follows. No modifications are allowed to the transport mode.

When performing a restore of a VMware virtual disk using this proxy server, the restore fails. What is a possible cause?

Transport Mode

Backup proxy transport mode:

☐ Automatic selection  
Data retrieval mode is selected automatically by analyzing backup proxy configuration and reachable VMFS and NFS datastores. Transport modes allowing for direct storage access will be used whenever possible.

☒ Direct storage access  
Data is retrieved directly from shared storage, without impacting production hosts. For block storage, backup proxy server must be connected into SAN fabric via hardware or software HBA, and have VMFS volumes mounted.

☐ Virtual appliance  
Data is retrieved directly from storage through hypervisor I/O stack by hot adding backed up virtual disks to a backup proxy VM. Datastores containing protected VMs must be connected to a host running backup proxy VM.

☐ Network  
Data is retrieved from storage through hypervisor network stack using NBD protocol over host management interface. This mode has no special setup requirements. Recommended for 10 Gb Ethernet or faster.

Options

☐ Failover to network mode if primary mode fails, or is unavailable

☐ Enable host to proxy traffic encryption in Network mode (NBDSSL)

OK Cancel

- A. CBT is disabled on the virtual disk.
- B. The virtual disk is thin-provisioned.
- C. CBT is enabled on the virtual disk.
- D. The virtual disk is thick-provisioned

**Answer: B**

Explanation:

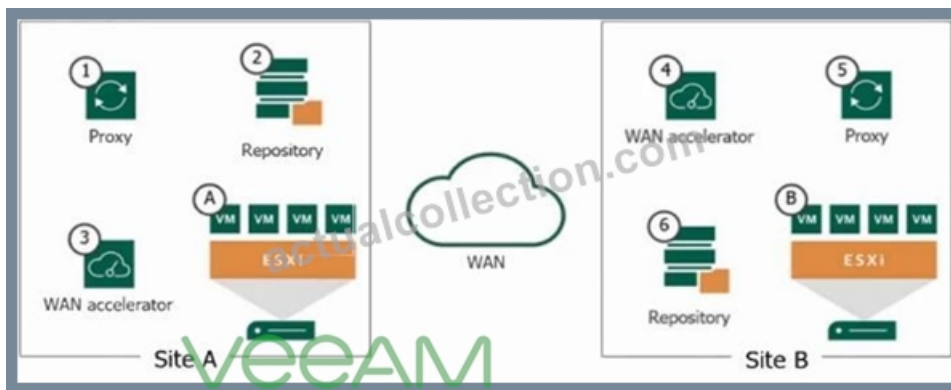

Given the provided transport modes and the fact that no modifications are allowed to these settings, a possible cause for the restore of a VMware virtual disk to fail using this proxy server is C: The virtual disk is thin-provisioned. In the transport modes shown, the Direct storage access and Virtual appliance options would require the VM disk files to be accessible in a certain way that might not be compatible with thin-provisioned disks depending on the storage configuration and the current state of the VM. If the storage integration specifics or the snapshot handling do not support the thin-provisioned format, the restore operation could fail.

It's important to ensure that the transport mode selected is compatible with the type of virtual disk being restored to prevent such issues.

#### NEW QUESTION # 62

Hourly backup jobs are configured to local repositories. Daily backups must be sent from Site B to the repository on Site A. The connection between the two sites does not allow a direct backup to complete within the backup window. Impact on the source VMs at Site B should be minimized.

Which type of job and Veeam components should be used to provide the necessary protection?

- A. A backup copy job and components 6 ? 5 ? 4 ? 3 ? 1 ? 2
- B. A backup job and components 5 ? 4 ? 3 ? 2
- C. A backup job and components 5 ? 2
- **D. A backup copy job and components 6 ? 4 ? 3 ? 2**

**Answer: D**

**Explanation:**

For the given scenario where daily backups need to be sent from Site B to a repository at Site A and the connection between the two sites is limited, thus impacting the ability to complete direct backups within the backup window, a Backup Copy Job would be appropriate. A Backup Copy Job is a feature in Veeam Backup & Replication that allows you to create several instances of the same backup files across different locations (repositories). In the image provided, the components involved in the Backup Copy Job from Site B to Site A would be:

6 (Repository at Site B): This is the source repository where the hourly backup jobs are stored.

4 and 3 (WAN Accelerators at both sites): These components optimize data transfer over the WAN.

2 (Repository at Site A): This is the target repository where the backup copies will be stored. This setup would minimize impact on the source VMs at Site B since the Backup Copy Job works with backup data rather than directly with the production VMs, thus reducing the load on those VMs during the process.

### NEW QUESTION # 63

An engineer needs to back up the data on a NAS file share, located on the company's main production site. Which option would increase the performance of the job?

- A. Assign Veeam WAN accelerators to the job.
- B. Deploy the backup proxy and the cache repository on a dedicated backup network.
- C. Assign a high priority to this job.
- **D. Deploy the backup proxy and the cache repository on the same network as the NAS.**

**Answer: D**

**Explanation:**

Placing the backup proxy and cache repository on the same network as the NAS file share helps to increase the performance of the backup job due to reduced latency and higher network speeds. This configuration allows for faster communication and data transfer between the NAS and the backup components, leading to more efficient backup operations.

### NEW QUESTION # 64

An engineer is using Veeam Backup and Replication v12.

The only backup repository is a Microsoft Windows server with direct attached Fibre Channel storage array.

The engineer realizes that none of their backups are immutable. A second copy of the backup on a different site and a different media is required.

Which option should be used to provide immutable backups on a secondary site with a different media?

- A. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and Google Cloud Object Storage with immutability enabled as the capacity tier.

- B. Create a new hardened repository on a new Microsoft Windows Server, mark it as immutable and create a backup copy job on it.
- **C. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and AWS S3 bucket with immutability enabled as the capacity tier.**
- D. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and an HPE StoreOnce Catalyst share with immutability enabled as the capacity tier.

**Answer: C**

Explanation:

To provide immutable backups on a secondary site with a different media, the best option given the context is B: Create a Scale Out Backup Repository (SOBR) with the existing Microsoft Windows Server as the performance tier and an AWS S3 bucket with immutability enabled as the capacity tier.

This approach involves leveraging the existing backup infrastructure (Microsoft Windows Server with direct-attached storage) as the performance tier of the SOBR, where the most recent backups are stored for fast access. For long-term storage and immutability, backups can be offloaded to an AWS S3 bucket configured with Object Lock. The Object Lock feature in AWS S3 provides an additional layer of data protection by making the backup data immutable, meaning it cannot be deleted or modified for a specified duration. This setup ensures that backup data is protected against accidental deletion, ransomware, and other malicious activities. By implementing this configuration, the engineer can achieve the desired level of data protection and immutability, utilizing cloud storage as a secure and scalable secondary backup location, distinct from the primary on-premises storage media.

### NEW QUESTION # 65

What can Veeam service providers deploy in Service Provider Console 7.0?

- A. Enterprise plugins
- B. Veeam One
- C. Veeam Backup & Replication
- **D. Veeam Backup for Microsoft 365**

**Answer: D**

Explanation:

In the Service Provider Console 7.0, Veeam service providers can deploy Veeam Backup for Microsoft 365.

This allows them to offer Microsoft 365 backup and recovery services to their customers, managing the protection of Microsoft 365 data including Exchange Online, SharePoint Online, OneDrive for Business, and Microsoft Teams data. References:
