Veeam Certified Engineer v12 Sample Questions (Q105-Q110):

NEW QUESTION # 105

Veeam is being used to back up a Microsoft SQL VM with transaction logs being backed up every 30 minutes to a repository that is local to the Veeam Backup and Replication server. Business requirements dictate that the database backup and all logs also be stored on a secondary, standalone repository in the DR datacenter. What should the Veeam engineer configure to meet the requirements?

- A. Backup Copy Job in Immediate mode
- B. SOBR with Copy mode enabled
- C. Backup Copy Job in Periodic Copy mode
- D. Backup Copy Job using the SQL Transaction Log Job as the source

Answer: A

Explanation:

You can not create a copy job for a transaction job since its a child job of the main backup job.

NEW QUESTION # 106

To be able to increase backup retention, the company has bought a Data Domain deduplication appliance.

After setting up the jobs to use it, the backup administrator observes an increase of resource consumption on the backup server. The proxy configuration has not been modified.

What is causing the issue?

- **A. The backup server has to fulfill the gateway role.**
- B. The backup server needs additional resources to use a deduplication appliance.
- C. The SSL certificate on the backup appliance needs to be updated.
- D. The backup appliance does not have enough resources to process the data.

Answer: A

Explanation:

When integrating a Data Domain deduplication appliance with Veeam Backup & Replication, it is typically used as a backup repository. The backup server may need to take on the gateway role, especially if the Data Domain is integrated over NFS or CIFS. This means that the backup server will be responsible for processing the data flow between the Veeam proxies and the deduplication appliance. If the gateway server (backup server) is not well-resourced, this additional workload can cause an increase in resource consumption on the backup server. The appliance's resources and the SSL certificate are not related to increased resource consumption on the backup server, and simply needing additional resources for deduplication (D) is not specific enough without indicating the gateway role.

NEW QUESTION # 107

A Veeam administrator wants to diagnose known issues in the configuration and performance of backup infrastructure without involving Veeam Technical Support.

What feature of Veeam One should the administrator use?

- A. Business View
- B. Log Shipping Servers
- **C. Intelligent Diagnostics**
- D. Best Practices Analyzer

Answer: C

Explanation:

For diagnosing known issues in the configuration and performance of the backup infrastructure without the direct involvement of Veeam Technical Support, the administrator should utilize A: Intelligent Diagnostics in Veeam One. Intelligent Diagnostics is a feature designed to proactively detect known issues within the Veeam backup infrastructure by analyzing the system's event logs, performance data, and configurations. It uses predefined patterns and rules derived from common issues identified by Veeam Support to provide early warnings and suggest corrective actions. This self-service approach enables administrators to address potential problems before they impact operations, enhancing the reliability and efficiency of the backup infrastructure.

NEW QUESTION # 108

If you need to run a script to stop a service in order to get an application-consistent backup on a Windows server, where can the script be run?

- A. Configure the script to run on the Veeam Backup & Replication server using the Windows Task Scheduler
- B. In the guest processing setting of the job, enable application-aware processing and add a pre-freeze script to the VM
- C. In the virtual machines setting of the job, add a script in the scripts tab under "Run the following script before the job:"
- **D. Copy the script to the VM and schedule the script to run prior to the start of the backup job using the Windows Task Scheduler in the VM**

Answer: D

NEW QUESTION # 109

The backup administrator configured replication for a VM from Data Center 1 to Data Center 2, which runs every day at 1 a.m. A power surge takes out Data Center 1 at 7 a.m. and the administrator fails over the replica at 8 a.m. When the power comes back on, the administrator performs the "failback" action at 2 p.m. and checks the state of the original VM. They recognize that not all data is available. What is missing?

- A. Data from 1 a.m. to 2 p.m.
- B. Data from 8 a.m. to 2 p.m.
- C. Data from 7 a.m. to 8 a.m.
- D. Data from 1 a.m. to 7 a.m.

Answer: A
