Quiz Latest GH-500 - GitHub Advanced Security Vce Format

May be you still strange to our GH-500 dumps pdf, you can download the free demo of the dump torrent before you buy. If you have any questions to our Microsoft exam questions torrent, please feel free to contact us and we will give our support immediately. You will be allowed to updating GH-500 Learning Materials one-year once you bought pdf dumps from our website.

Microsoft GitHub Advanced Security Sample Questions (Q32-Q37):

NEW QUESTION # 32

Secret scanning will scan:

- A. Any Git repository.
- B. A continuous integration system.
- C. External services.
- D. The GitHub repository.

Answer: D

Explanation:

Secret scanning is a feature provided by GitHub that scans the contents of your GitHub repositories for known types of secrets, such as API keys and tokens. It operates within the GitHub environment and does not scan external systems, services, or repositories outside of GitHub. Its primary function is to prevent the accidental exposure of sensitive information within your GitHub-hosted code.

NEW QUESTION # 33

Which of the following Watch settings could you use to get Dependabot alert notifications? (Each answer presents part of the solution. Choose two.)

- A. The Custom setting
- B. The Participating and @mentions setting
- C. The All Activity setting
- D. The Ignore setting

Answer: A,C

Explanation:

Comprehensive and Detailed Explanation:

To receive Dependabot alert notifications for a repository, you can utilize the following Watch settings:

Custom setting: Allows you to tailor your notifications, enabling you to subscribe specifically to security alerts, including those from Dependabot.

All Activity setting: Subscribes you to all notifications for the repository, encompassing issues, pull requests, and security alerts like those from Dependabot.

The Participating and @mentions setting limits notifications to conversations you're directly involved in or mentioned, which may not include security alerts. The Ignore setting unsubscribes you from all notifications, including critical security alerts.

NEW QUESTION # 34

Assuming there is no custom Dependabot behavior configured, where possible, what does Dependabot do after sending an alert about a vulnerable dependency in a repository?

- A. Scans any push to all branches and generates an alert for each vulnerable repository
- B. Constructs a graph of all the repository's dependencies and public dependents for the default branch
- C. Creates a pull request to upgrade the vulnerable dependency to the minimum possible secure version
- D. Scans repositories for vulnerable dependencies on a schedule and adds those files to a manifest

Answer: C

Explanation:

After generating an alert for a vulnerable dependency, Dependabot automatically attempts to create a pull request to upgrade that dependency to the minimum required secure version-if a fix is available and compatible with your project.

This automated PR helps teams fix vulnerabilities quickly with minimal manual intervention. You can also configure update behaviors using dependabot.yml, but in the default state, PR creation is automatic.

NEW QUESTION # 35

Which of the following workflow events would trigger a dependency review? (Each answer presents a complete solution. Choose two.)

- A. pull_request
- B. workflow_dispatch
- C. commit
- D. trigger

Answer: A,B

Explanation:

Comprehensive and Detailed Explanation:

Dependency review is triggered by specific events in GitHub workflows:

pull_request: When a pull request is opened, synchronized, or reopened, GitHub can analyze the changes in dependencies and provide a dependency review.

workflow_dispatch: This manual trigger allows users to initiate workflows, including those that perform dependency reviews.

The trigger and commit options are not recognized GitHub Actions events and would not initiate a dependency review.

NEW QUESTION # 36

What does code scanning do?

- A. It scans your entire Git history on branches present in your GitHub repository for any secrets
- B. It prevents code pushes with vulnerabilities as a pre-receive hook
- C. It contacts maintainers to ask them to create security advisories if a vulnerability is found
- **D. It analyzes a GitHub repository to find security vulnerabilities**

Answer: D

Explanation:

Code scanning is a static analysis feature that examines your source code to identify security vulnerabilities and coding errors. It runs either on every push, pull request, or a scheduled time depending on the workflow configuration.

It does not automatically contact maintainers, scan full Git history, or block pushes unless explicitly configured to do so.

NEW QUESTION # 37

.....

It is known to us that our GH-500 study materials are enjoying a good reputation all over the world. Our study materials have been approved by thousands of candidates. You may have some doubts about our product or you may suspect the pass rate of it, but we will tell you clearly, it is totally unnecessary. If you still do not trust us, you can choose to download demo of our GH-500 Test Torrent. Now I will introduce you our GitHub Advanced Security exam tool in detail, I hope you will like our product.
