# Real Trend Deep-Security-Professional Exam Questions with Verified Answers

BONUS!!! Download part of Exam4Docs Deep-Security-Professional dumps for free: https://drive.google.com/open?id=1GwMIE-yRG5nAHAywZfYXOY-7phv7p00R

Along with the three version of our Deep-Security-Professional exam braindumps: the PDF, Software and APP online, we also offer you the best practicing opportunity to ace exam in your first try. They are the special trial versions-the free demos of the Deep-Security-Professional practice engine that provides you the latest questions and answers to have a try on not only the content but also the displays. With these free demos, you can test and check the quality of the Deep-Security-Professional Study Guide, and have a nice experience to practice on them.

The Trend Micro Certified Professional for Deep Security certification exam is designed for professionals who work with Trend Micro's Deep Security platform and want to validate their skills and knowledge. This includes IT administrators, security analysts, system engineers, and consultants. Trend Micro Certified Professional for Deep Security certification exam is also ideal for those who want to enhance their career prospects and increase their earning potential in the field of cybersecurity. By passing the Trend Micro Certified Professional for Deep Security exam, professionals can demonstrate their expertise in securing IT environments using one of the most advanced security platforms in the market.

Trend Deep-Security-Professional Practice Test Online, Reliable Deep-Security-Professional Braindumps

Exam4Docs Trend Deep-Security-Professional exam training materials are provided in PDF format and software format. It contains Trend Deep-Security-Professional exam questions and answers. These issues are perfect, Which can help you to be successful in the Trend Deep-Security-Professional Exam. Exam4Docs Trend Deep-Security-Professional exam comprehensively covers all syllabus and complex issues. The Exam4Docs Trend Deep-Security-Professional exam questions and answers is the real exam challenges, and help you change your mindset.

Trend Deep-Security-Professional Exam covers a range of topics related to Trend Micro Deep Security, including installation and deployment, policy creation and management, event monitoring and analysis, and troubleshooting. Deep-Security-Professional exam is designed to test the candidate's knowledge of these topics and their ability to apply this knowledge in real-world scenarios. Trend

Micro Certified Professional for Deep Security certification is intended for professionals who work with Trend Micro Deep Security on a regular basis, including security administrators, network engineers, and system administrators. By earning this certification, professionals can demonstrate their expertise in securing virtual and cloud-based environments and enhance their career prospects in the field of cybersecurity.

To prepare for the Trend Micro Certified Professional for Deep Security exam, candidates should have a solid understanding of cybersecurity fundamentals, as well as experience working with Deep Security. Trend Micro offers training courses and resources to help candidates prepare for the exam, including instructor-led courses, self-paced online courses, and exam preparation guides. Additionally, there are many third-party resources available, such as study guides and practice exams.

Trend Micro Certified Professional for Deep Security Sample Questions (Q23-Q28):

NEW QUESTION # 23
What is the purpose of the Deep Security Notifier?

- A. The Deep Security Notifier is a application in the Windows System Tray that com-municates the state of Deep Security Agents and Relays to endpoint computers.
- B. The Deep Security Notifier is a server component used in agentless configurations to allow Deep Security Manager to notify managed computers of pending updates.
- C. The Deep Security Notifier is a application in the Windows System Tray that displays the Status of Deep Security Manager during policy and software updates.
- D. The Deep Security Notifier is a server components that collects log entries from man-aged computers for delivery to a configured SIEM device.

Answer: A

Explanation:
The Deep Security Notifier is a Windows System Tray application which provides local notification when malware is detected or malicious URLs are blocked.
It may be installed separately on protected virtual machines, however the Anti-Malware Protection Module must be licensed and enabled on the virtual machine for the Deep Security Notifier to display information.
The Notifier displays pop-up user notifications when the Anti-Malware module begins a scan, or blocks malware or access to malicious web pages. The Notifier also provides a console utility that allows the user to view events.
Explication: Study Guide - page (442)

NEW QUESTION # 24
Which of following statements best describes Machine Learning in Deep Security?

- A. Machine Learning is a malware detection technique in which files are scanned based on the true file type as determined by the file content, not the extension.
- B. Machine Learning is a malware detection technique in which the Deep Security Agent monitors process memory in real time and once a process is deemed to be suspicious, Deep Security will perform additional checks with the Smart Protection Network to determine if this is a known good process.
- C. Machine Learning is malware detection technique in which features of an executable file are compared against a cloud-based learning model to determine the probability of the file being malware.
- D. Machine Learning is malware detection technique in which processes on the protected computer are monitored for actions that are not typically performed by a given process.

Answer: C

Explanation:
Machine Learning in Trend Micro Deep Security analyzes files by extracting a set of features from an executable file and comparing those features against a cloud-based machine learning model. This allows the system to determine the probability that the file is malware before it is allowed to execute, providing advanced protection even for previously unknown threats. This process is distinct from scanning based on file type, behavioral monitoring, or process monitoring.

NEW QUESTION # 25

The Intrusion Prevention Protection Module is enabled, its Behavior is set to Prevent and rules are assigned.

When viewing the events, you notice that one of Intrusion Prevention rules is being triggered and an event is being logged but the traffic is not being blocked. What is a possible reason for this?

- A. The default Prevention Behavior in this particular rule may be set to Detect. This logs the triggering of the rule, but does not actually enforce the block.
- B. The Deep Security Agent is experiencing a system problem and is not processing packets since the "Network Engine System Failure" mode is set to "Fail Open".
- C. The network engine is running in Inline mode. In Inline mode, Deep Security provides no protection beyond a record of events.
- D. The Intrusion Prevention rule is being triggered as a result of the packet sanity check failing and the packet is being allowed to pass.

Answer: A

Explanation:

If the Intrusion Prevention rule's behavior is set to Detect rather than Prevent, it will log events when the rule is triggered but will not block the associated traffic. This can happen even if the module's overall setting is Prevent, because individual rules can have their own behavior configuration.

NEW QUESTION # 26

Your VMware environment is configured without using NSX. How can Deep Security provide protection to the virtual images hosted on your ESXi servers?

- A. Without NSX, you will be unable to use Deep Security to protect your virtual machines.
- B. Without NSX, you can only enable Anti-Malware and Integrity Monitoring protection on the virtual machines. NSX is required to support Intrusion Prevention, Firewall and Web Reputation
- C. You can install a Deep Security Virtual Appliance on the ESXi server. This will provide agentless support for Anti-Malware, Intrusion Prevention, Integrity Monitoring, Firewall and Web Reputation.
- D. Without NSX, a Deep Security Agent must be installed on each virtual machine hosted on the ESXi server.

Answer: D

Explanation:

In a VMware environment without NSX, agent-based protection is required. This means that the Deep Security Agent must be installed individually on each VM to provide protection. Agentless protection via the Virtual Appliance is only available in environments integrated with NSX.

NEW QUESTION # 27

Which of the following is not an operation that is performed when network traffic is intercepted by the network driver on the Deep Security Agent?

- A. Verify the integrity of the packet to insure the packet is suitable for analysis.
- B. Analyze the packet within the context of traffic history and connection state.
- C. Verify the packet is not part of a reconnaissance scan used to discover weaknesses on the Deep Security Agent host computer.
- D. Compare the data in the packet against the Anti-Malware Scan Configuration to verify whether any of the data related to files and folders on the Exclusion list.

Answer: D
