Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q265-Q270):

NEW QUESTION # 265

An application needs to use the IP address of the client in its processing. The application has been moved into AWS and has been placed behind an Application Load Balancer (ALB). However, all the client IP addresses now appear to be the same. The application must maintain the ability to scale horizontally.

Based on this scenario, what is the MOST cost-effective solution to this problem?

- A. Alter the application code to inspect a custom header. Alter the client code to pass the IP address in the custom header.
- B. Remove the application from the ALB. Delete the ALB and change Amazon Route 53 to direct traffic to the instance running the application.
- C. Remove the application from the ALB. Create a Classic Load Balancer in its place. Direct traffic to the application using the HTTP protocol.
- D. **Alter the application code to inspect the X-Forwarded-For header. Ensure that the code can work properly if a list of IP addresses is passed in the header.**

Answer: D

NEW QUESTION # 266

A development team maintains a web application by using a single AWS CloudFormation template. The template defines web servers and an Amazon RDS database. The team uses the Cloud Formation template to deploy the Cloud Formation stack to different environments.

During a recent application deployment, a developer caused the primary development database to be dropped and recreated. The result of this incident was a loss of data. The team needs to avoid accidental database deletion in the future.

Which solutions will meet these requirements? (Choose two.)

- A. **Add a CloudFormation Deletion Policy attribute with the Retain value to the database resource.**
- B. **Create a CloudFormation stack set for the web application and database deployments.**
- C. Update the CloudFormation stack policy to prevent updates to the database.
- D. Modify the database to use a Multi-AZ deployment.
- E. Add a Cloud Formation DeletionPolicy attribute with the Retain value to the stack.

Answer: A,B

NEW QUESTION # 267

A developer is building an application that uses an Amazon RDS for PostgreSQL database. To meet security requirements, the developer needs to ensure that data is encrypted at rest. The developer must be able to rotate the encryption keys on demand.

- A. **Create a symmetric customer managed AWS KMS key. Use the key to encrypt the database.**
- B. Create a 256-bit AES-GCM encryption key. Store the key in AWS Secrets Manager, and enable managed rotation. Use the key to encrypt the database.
- C. Create a 256-bit AES-GCM encryption key. Store the key in AWS Secrets Manager. Configure an AWS Lambda function to perform key rotation. Use the key to encrypt the database.
- D. Use an AWS KMS managed encryption key to encrypt the database.

Answer: A

Explanation:

* Why Option B is Correct: A customer-managed AWS Key Management Service (KMS) key allows for encryption at rest and provides the ability to rotate the key on demand. This ensures compliance with security requirements for key management and database encryption.

* RDS integrates natively with AWS KMS, allowing the use of a customer-managed key for encrypting data at rest.

* Key rotation can be managed directly in AWS KMS without needing custom solutions.

* Why Other Options are Incorrect:

* Option A: AWS KMS managed encryption keys (AWS-owned keys) do not support key rotation on demand.

* Option C & D: Storing keys in AWS Secrets Manager with custom rotation is not a recommended approach for database encryption. AWS KMS is designed specifically for secure key management and encryption.

* AWS Documentation References:

* Encrypting Amazon RDS Resources

* AWS Key Management Service (KMS)

NEW QUESTION # 268

You attempt to store an object in the US-STANDARD region in Amazon S3, and receive a confirmation that it has been successfully stored. You then immediately make another API call and attempt to read this object. S3 tells you that the object does not exist.

What could explain this behavior?

- A. Objects in Amazon S3 do not become visible until they are replicated to a second region.
- B. US-STANDARD imposes a 1 second delay before new objects are readable.
- C. You exceeded the bucket object limit, and once this limit is raised the object will be visible.
- D. **US-STANDARD uses eventual consistency and it can take time for an object to be readable in a bucket**

Answer: D

NEW QUESTION # 269

A developer is incorporating AWS X-Ray into an application that handles personal identifiable information (PII). The application is hosted on Amazon EC2 instances. The application trace messages include encrypted PII and go to Amazon CloudWatch. The developer needs to ensure that no PII goes outside of the EC2 instances.

Which solution will meet these requirements?

- A. Manually instrument the X-Ray SDK in the application code.
- B. **Use the X-Ray auto-instrumentation agent.**
- C. Use Amazon Macie to detect and hide PII. Call the X-Ray API from AWS Lambda.
- D. Use AWS Distro for Open Telemetry.

Answer: B
