Fore Scout Certified Professional Exam Sample Questions (Q25-Q30):

NEW QUESTION # 25

How can scripts be run when the Endpoint Remote Inspection method is set to "Using MS-WMI"?

- A. Using WMI, which will allow interactive scripts to run
- **B. Using WMI, but they may not be run interactively using this method**
- C. Using RRP, which will allow interactive scripts to run
- D. Using fsprocserv.exe, but scripts may not be run interactively using this method
- E. Using Task Scheduler but this has limitations

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

According to the Forescout CounterACT HPS Inspection Engine Configuration Guide Version 10.8, when the Endpoint Remote Inspection method is set to "Using MS-WMI," scripts are run using WMI, but they may not be run interactively using this method.

MS-WMI Script Execution:

According to the HPS Inspection Engine guide:

"When Remote Inspection uses MS-WMI, run scripts with

* MS-WMI - note that interactive scripts are not supported by WMI on all Windows endpoints.

Functionality that relies on interactive endpoint scripts is not implemented when you choose this option. For example, the Start Antivirus and Update Antivirus actions require interactive scripts to manage some antivirus packages." Interactive Script Limitations with WMI:

According to the documentation:

"WMI does not support interactive scripts (such as scripts that support Guest Registration and other HTTP- based actions) on some Windows endpoints." How WMI Scripts Are Run:

According to the documentation:

When using WMI for script execution:

* Background Scripts - Most background scripts can run via WMI

* Interactive Scripts - NOT supported by WMI on all endpoints

* Workaround for Interactive Scripts - CounterACT uses:

* fsprocsvc service (fsprocsvc.exe) - For interactive script support

* Microsoft Task Scheduler - Alternative for interactive scripts

WMI vs. Other Methods:

According to the documentation:

Method

Interactive Scripts

Limitations

MS-WMI

Not supported on all endpoints

Limited to background scripts

fsprocsvc

Supported

Service must be running

Task Scheduler

Not on Vista/7

Legacy OS limitations

Script Execution Flow with MS-WMI:

According to the documentation:

"CounterACT runs most background scripts using WMI. WMI does not support interactive scripts (such as scripts that support Guest Registration and other HTTP-based actions) on some Windows endpoints.

CounterACT uses the fsprocsvc service or Microsoft Task Scheduler to run interactive scripts on these endpoints." Why Other Options Are Incorrect:

* A. Using Task Scheduler but with limitations - Task Scheduler is an ALTERNATIVE to WMI, not what MS-WMI uses

* B. Using WMI, which will allow interactive scripts - Incorrect; WMI does NOT allow interactive scripts

* C. Using RRP, which will allow interactive scripts - RRP is Remote Registry Protocol, not the script execution method with MS-WMI

* E. Using fsprocserv.exe, but scripts may not be run interactively - fsprocserv.exe (fsprocsvc) DOES support interactive scripts; it's used as an alternative to overcome WMI limitations Referenced Documentation:

NEW QUESTION # 26

What should you do first when preparing for an upgrade to a new CounterACT version?

- A. Upgrade only the modules compatible with the version you are installing.
- B. Upgrading an appliance is done through Options/Modules.
- **C. Consult the CounterACT Release Notes for the appropriate version**
- D. From the appliance CLI, fstool upgrade /tmp/counteract-v8.0.1.fsp
- E. Upgrade the members first before upgrading the EM.

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

According to the Forescout Upgrade Guides for multiple versions, the first thing you should do when preparing for an upgrade to a new CounterACT version is consult the CounterACT Release Notes for the appropriate version.

Release Notes as First Step:

According to the official documentation:

"Review the Forescout Release Notes for important information before performing any upgrade." The documentation emphasizes this as a critical first step before any other upgrade activities.

What Release Notes Contain:

According to the upgrade guidance:

The Release Notes provide essential information including:

- * Upgrade Paths - Which versions you can upgrade from and to
- * Pre-Upgrade Requirements - System requirements and prerequisites
- * End-of-Life Products - Products that must be uninstalled before upgrade
- * Non-Supported Products - Products not compatible with the new version
- * Module/Plugin Dependencies - Version compatibility requirements
- * Known Issues - Potential problems and workarounds
- * Upgrade Procedures - Step-by-step instructions
- * Rollback Information - How to revert if needed

Critical Pre-Upgrade Information:

According to the Release Notes guidance:

"The upgrade process does not continue when end-of-life products are detected." Release Notes list:

- * End-of-Life (EOL) Products - Must be uninstalled before upgrade
- * Non-Supported Products - Must be uninstalled before upgrade
- * Plugin Version Compatibility - Which plugin versions work with the new Forescout version Upgrade Order vs. Release Notes

Review:

According to the documentation:

While the order of upgrade (EM first, then Appliances) is important, consulting Release Notes comes FIRST because it determines what needs to be done before any upgrade attempts.

The Release Notes tell you:

- * Whether you can upgrade at all
- * What must be uninstalled
- * System requirements
- * Compatibility information

Only AFTER reviewing Release Notes do you proceed with the actual upgrade sequence.

Why Other Options Are Incorrect:

- * A. Upgrade the members first before upgrading the EM - This is the OPPOSITE of correct order; EM (Enterprise Manager) should be upgraded first
- * B. Upgrading an appliance is done through Options/Modules - This is not the upgrade path; upgrades are done through Tools > Options > CounterACT Devices
- * C. From the appliance CLI, fstool upgrade /tmp/counteract-v8.0.1.fsp - This is ONE possible upgrade method, but not the first step; downloading and reviewing Release Notes comes first
- * E. Upgrade only the modules compatible with the version you are installing - This is a consideration found IN the Release Notes, not the first step itself

Correct Upgrade Sequence:

According to the comprehensive upgrade documentation:

text

1. FIRST: Review Release Notes (determine what's needed)
2. Second: Check system requirements
3. Third: Uninstall EOL/non-supported products

4. Fourth: Back up Enterprise Manager and Appliances
 5. Fifth: Upgrade Enterprise Manager
 6. Sixth: Upgrade Appliances
- Referenced Documentation:

NEW QUESTION # 27

When using the "Assign to VLAN action," why might it be useful to have a policy to record the original VLAN?
Select one:

- A. Since CounterACT reads the startup config to find the original VLAN, network administrators saving configuration changes to switches could overwrite this VLAN information
- **B. Since CounterACT reads the running config to find the original VLAN, any changes to switch running configs could overwrite this VLAN information**
- C. Since CounterACT reads the startup config to find the original VLAN, network administrators making changes to switch running configs could overwrite this VLAN information
- D. Since CounterACT reads the running config to find the original VLAN, network administrators making changes to switch running configs could overwrite this VLAN information
- E. Since CounterACT reads the running config to find the original VLAN, network administrators saving configuration changes to switches could overwrite this VLAN information

Answer: B

Explanation:

According to the Forescout Switch Plugin documentation, the correct answer is: "Since CounterACT reads the running config to find the original VLAN, any changes to switch running configs could overwrite this VLAN information".

Why Recording Original VLAN is Important:

According to the documentation:

When CounterACT assigns an endpoint to a quarantine VLAN:

- * Reading Original VLAN - CounterACT reads the switch running configuration to determine the original VLAN
 - * Temporary Change - The endpoint is moved to the quarantine VLAN
 - * Restoration Issue - If network administrators save configuration changes to the running config, CounterACT's reference to the original VLAN may be overwritten
 - * Solution - Recording the original VLAN in a policy ensures you have a backup reference
- Why Option D is the Most Accurate:
Option D states the key issue clearly: "any changes to switch running configs could overwrite this VLAN information." This is the most comprehensive and accurate statement because it acknowledges that ANY changes (not just those by administrators specifically) could cause the issue.

NEW QUESTION # 28

What should be done after the Managed Windows devices are sent to a policy to determine the Windows 10 patch delivery optimization setting?

- A. Push out the proper DWORD setting via GPO
- B. Non Windows 10 devices must be called out in sub-rules so that the relevant DWORD value may be changed
- **C. Write sub-rules to check for each of the DWORD values used in patch delivery optimization**
- D. Non Windows 10 devices must be called out in sub-rules since they will not have the relevant DWORD
- E. Manageable Windows devices are not required by this policy

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

After managed Windows devices are sent to a policy to determine the Windows 10 patch delivery optimization setting, the best practice is to write sub-rules to check for each of the DWORD values used in patch delivery optimization.

Windows 10 Patch Delivery Optimization DWORD Values:

Windows 10 patch delivery optimization is configured through DWORD registry settings in the following registry path:

* Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Windows\DeliveryOptimization The primary DWORD value is DODownloadMode, which supports the following values:

- * 0 = HTTP only, no peering
- * 1 = HTTP blended with peering behind the same NAT (default)
- * 2 = HTTP blended with peering across a private group
- * 3 = HTTP blended with Internet peering
- * 63 = HTTP only, no peering, no use of DO cloud service
- * 64 = Bypass mode (deprecated in Windows 11)

Why Sub-Rules Are Required:

When implementing a policy to manage Windows 10 patch delivery optimization settings, administrators must create sub-rules for each possible DWORD configuration value because:

- * Different Organizational Requirements - Different departments or network segments may require different delivery optimization modes (e.g., value 1 for some devices, value 0 for others)
- * Compliance Checking - Each sub-rule verifies whether a device has the correct DWORD value configured according to organizational policy
- * Enforcement Actions - Once each sub-rule identifies a specific DWORD value, appropriate remediation actions can be applied (e.g., GPO deployment, messaging, notifications)
- * Granular Control - Sub-rules allow for precise identification of devices with non-compliant delivery optimization settings

Implementation Workflow:

- * Device is scanned and identified as Windows 10 managed device
- * Policy queries the DODownloadMode DWORD registry value
- * Multiple sub-rules evaluate the current DWORD value:
- * Sub-rule for value "0" (HTTP only)
- * Sub-rule for value "1" (Peering behind NAT)
- * Sub-rule for value "2" (Peering across private group)
- * Sub-rule for value "3" (Internet peering)
- * Sub-rule for value "63" (No peering, no cloud)
- * Matching sub-rule triggers appropriate policy actions

Why Other Options Are Incorrect:

- * A. Push out the proper DWORD setting via GPO - This is what you do AFTER checking via sub-rules, not what you do after sending devices to the policy
- * B. Non Windows 10 devices must be called out in sub-rules since they will not have the relevant DWORD - While non-Windows 10 devices should be excluded, the answer doesn't address the core requirement of checking each DWORD value
- * C. Manageable Windows devices are not required by this policy - This is incorrect; managed Windows devices are the focus of this policy
- * D. Non Windows 10 devices must be called out in sub-rules so that the relevant DWORD value may be changed - This misses the point; you check the DWORD values first, not change them in sub-rules Referenced Documentation:

NEW QUESTION # 29

Where are the plugin logs located in the CounterACT CLI?

- A. /usr/local/forescout/log/plugin/<plugin ID>
- B. /usr/local/forescout/plugin/<plugin ID>/log
- C. /usr/local/forescout/log
- D. /usr/local/log/plugin/<plugin ID>
- E. /usr/local/forescout/plugin/log/<plugin ID>

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract of Forescout Platform Administration and Deployment:

According to the Forescout CLI Commands Reference Guide and official documentation, the plugin logs in the CounterACT CLI are located at the path /usr/local/forescout/log/plugin/<plugin ID>.

CLI Log File Structure:

The Forescout CLI organizes log files in a hierarchical directory structure. When using the CLI to access logs, administrators can navigate through the following directory structure:

- * log - View appliance log files

- * logplugin - Access plugin-specific log directories
- * logplugin/<plugin ID> - Access logs for a specific plugin

Example Plugin Log Locations:

According to the documentation, specific plugin logs can be accessed using the following CLI commands:

text

```
list logplugin/<plugin ID>
```

```
monitor logplugin/<plugin ID>/<plugin_name>.log
```

For example, the Python server logs for the Connect Module are located at: /usr/local/forescout/plugin

/connect_module/python_logs

CLI Commands for Accessing Plugin Logs:

The correct CLI syntax for accessing plugin logs includes:

text

```
list logplugin/<plugin ID> - Lists plugin log directory contents
```

```
monitor logplugin/<plugin ID>/<plugin_name>.log - Monitors plugin log in real-time view logplugin/<plugin ID>/<plugin_name>.log
```

- Views plugin log file contents search <pattern> logplugin/<plugin ID>/<plugin_name>.log - Searches within plugin logs Why Other Options Are Incorrect:

- * A. /usr/local/forescout/plugin/<plugin ID>/log - Inverted directory structure; log is a parent directory, not a subdirectory of the plugin ID

- * B. /usr/local/forescout/plugin/log/<plugin ID> - Incorrect path structure; "log" is not a subdirectory under "plugin"

- * C. /usr/local/forescout/log - Too generic; this path refers to appliance-wide logs, not plugin-specific logs

- * D. /usr/local/log/plugin/<plugin ID> - Incorrect root path; Forescout logs are stored under /usr/local

/forescout, not /usr/local
