Amazon AWS Certified Advanced Networking Specialty Exam Sample Questions (Q163-Q168):

NEW QUESTION # 163

Which of the following services is used to send an alert from CloudWatch?

Response:

- A. AWS SES
- **B. AWS SNS**
- C. AWS SQS
- D. AWS EBS

Answer: B

NEW QUESTION # 164

A company deploys a software solution on Amazon EC2 instances that are in a cluster placement group. The solution's UI is a single HTML page. The HTML file size is 1,024 bytes. The software processes files that exceed 1,024 MB in size. The software shares files over the network to clients upon request. The files are shared with the Don't Fragment flag set. Elastic network interfaces of the EC2 instances are set up with jumbo frames.

The UI is always accessible from all allowed source IP addresses, regardless of whether the source IP addresses are within a VPC, on the internet, or on premises. However, clients sometimes do not receive files that they request because the files fail to travel successfully from the software to the clients.

Which options provide a possible root cause of these failures? (Choose two.)

- A. The source IP addresses are from on-premises hosts that are routed over AWS Direct Connect.
- B. The operating system of the EC2 instances does not support jumbo frames.
- C. The security group of the EC2 instances does not allow ICMP traffic.
- **D. The source IP addresses are from hosts that connect over the public internet.**
- **E. The source IP addresses are from on-premises hosts that are routed over AWS Site-to-Site VPN.**

Answer: D,E

NEW QUESTION # 165

Your company runs an application for the US market in the us-east-1 AWS region. This application uses proprietary TCP and UDP protocols on Amazon Elastic Compute Cloud (EC2) instances.

End users run a real-time, front-end application on their local PCs. This front-end application knows the DNS hostname of the service. You must prepare the system for global expansion. The end users must access the application with lowest latency.

How should you use AWS services to meet these requirements?

Response:

- A. Set the Elastic Load Balancing (ELB) load balancer in front of the hosts of the service, and register the ELB name of the main service host as an ALIAS record with a latency-based routing policy in Route 53.
- B. Set Amazon CloudFront in front of the host of the service, and register the CloudFront name of the main service as an ALIAS record in Route 53.
- C. Set the Amazon API gateway in front of the service, and register the API gateway name of the main service as an ALIAS record in Route 53.
- **D. Register the IP addresses of the service hosts as "A" records with latency-based routing policy in Amazon Route 53, and set a Route 53 health check for these hosts.**

Answer: D

NEW QUESTION # 166

A business is transferring a classic storefront online application to the Amazon Web Services (AWS) Cloud. The program is

sophisticated and refactoring will take many months.

Until the replacement web application is completed and deployed, a solutions architect proposed utilizing Amazon CloudFront with a custom origin connecting to the SSL endpoint URL for the old web application.

For many weeks, the intermediate solution worked. However, all browser connections have lately begun to display an HTTP 502 Bad Gateway error with the header 'X-Cache: Error from cloudfront.

Monitoring services indicate that the traditional web application's HTTPS port 443 is accessible and accepting requests. What is the most probable source of the mistake, and how do you fix it?

Response:

- A. The SSL certificate on the legacy web application server has expired. Use AWS Certificate Manager (ACM) in the us-east-1 Region to create a new SSL certificate. Export the public and private keys, and install the certificate on the legacy web application
- B. The SSL certificate on the legacy web application server has expired. Replace the SSL certificate on the web server with one signed by a globally recognized certificate authority (CA). Install the full certificate chain onto the legacy web application server
- C. The SSL certificate on the CloudFront distribution has expired. Use AWS Certificate Manager (ACM) in the us-east-1 Region to replace the SSL certificate in the CloudFront distribution with a new certificate
- **D. The origin access identity is not correct. Edit the CloudFront distribution and update the identity in the origins settings**

Answer: D

NEW QUESTION # 167

In AWS, which tool records API calls for a specific AWS account and also delivers the log files for that account?

Response:

- **A. CloudTrail**
- B. Bearstalk
- C. Redshift
- D. Cognito

Answer: A
