VMware NSX 4.X Professional V2 Sample Questions (Q121-Q126):

NEW QUESTION # 121
An administrator has connected two virtual machines on the same overlay segment. Ping between both virtual machines is successful. What type of network boundary does this represent?

- A. Layer 2 broadcast domain
- B. Layer 2 bridge
- C. Layer 2 VPN
- D. Layer 3 route

Answer: A

Explanation:
An overlay segment is a logical construct that provides Layer 2 connectivity between virtual machines that are attached to it. An overlay segment can span multiple hosts and can be extended across different subnets or locations using Geneve encapsulation3. Therefore, two virtual machines on the same overlay segment belong to the same Layer 2 broadcast domain, which means they can communicate with each other using their MAC addresses without requiring any routing. The other options are incorrect because they involve Layer 3 or higher network boundaries, which require routing or tunneling to connect different segments.

NEW QUESTION # 122
An NSX administrator has deployed a single NSX Manager node and will be adding two additional nodes to form a 3-node NSX Management Cluster for a production environment. The administrator will deploy these two additional nodes and Cluster VIP using the NSX UI.
What two are the prerequisites for this configuration? (Choose two.)

- A. All nodes must be in the same subnet.
- B. NSX Manager must reside on a Windows Server.
- C. The cluster configuration must be completed using API.
- D. A compute manager must be configured.
- E. All nodes must be in separate subnets.

Answer: A,D

Explanation:
For a 3-node NSX Manager cluster, all nodes must be within the same subnet to ensure proper communication and functionality between them.
A compute manager must be configured before adding nodes to the cluster, as it provides the necessary integration between the NSX Manager and the underlying virtualization infrastructure (such as vSphere or vCenter).

NEW QUESTION # 123
Which two steps must an NSX administrator take to integrate VMware Identity Manager in NSX to support role-based access control? (Choose two.)

- A. Enter the service URL, Client Secret, and SSL thumbprint in NSX Manager.
- B. Enter the Identity Provider (IdP) metadata URL in NSX Manager.
- C. Create a SAML authentication in VMware Identity Manager using the NSX Manager FQDN.
- D. Add NSX Manager as a Service Provider (SP) in VMware Identity Manager.
- E. Create an OAuth 2.0 client in VMware Identity Manager.

Answer: B,D

Explanation:
Adding NSX Manager as a Service Provider (SP) in VMware Identity Manager is necessary to enable SAML-based single sign-on (SSO), which allows VMware Identity Manager to manage and authenticate users accessing NSX.

Entering the Identity Provider (IdP) metadata URL in NSX Manager is required to establish a connection between NSX and VMware Identity Manager, enabling NSX to use VMware Identity Manager as the IdP for authentication.

NEW QUESTION # 124

Which statement is true about an alarm in a Suppressed state?

- A. An alarm can be suppressed for a specific duration in days.
- B. An alarm can be suppressed for a specific duration in minutes.
- C. An alarm can be suppressed for a specific duration in seconds.
- D. An alarm can be suppressed for a specific duration in hours.

Answer: D

Explanation:
An alarm can be suppressed for a specific duration in hours.
According to the VMware NSX documentation, an alarm can be in one of the following states: Open, Acknowledged, Suppressed, or Resolved12 An alarm in a Suppressed state means that the status reporting for this alarm has been disabled by the user for a user-specified duration12 When a user moves an alarm into a Suppressed state, they are prompted to specify the duration in hours. After the specified duration passes, the alarm state reverts to Open. However, if the system determines the condition has been corrected, the alarm state changes to Resolved13 To learn more about how to manage alarm states in NSX, you can refer to the following resources:

NEW QUESTION # 125

Which tool could be used to configure BGP on a Tier-0 Gateway?

- A. NSX CLI
- B. ESX CLI
- C. API
- D. iPerf3

Answer: A,C
