#### Answer: C

#### **NEW OUESTION #46**

Which attack mitigation must be in place to prevent an attacker from authenticating to a service using a brute force attack?

- A. Use of multifactor authentication for all accounts
- B. Use of a 100 ms delay between each authentication
- C. Use of a password manager
- D. Forced password change every 6 months

#### Answer: A

#### Explanation:

Multifactor Authentication (MFA) is one of the most effective mitigations against brute-force attacks. Even if an attacker guesses or steals a user's password, they would still need a second authentication factor (e.g., push notification, hardware token, biometric verification) to complete login.

SCAZT Section 2: User and Device Security (Pages 40-43) emphasizes the importance of MFA in protecting identities from password spraying, credential stuffing, and brute-force attacks.

#### **NEW QUESTION #47**

What helps prevent drive-by compromise?

- A. Browsing known websites
- B. Ad blockers
- C. VPN
- D. Incognito browsing

#### Answer: B

#### Explanation:

A drive-by compromise occurs when malicious code is automatically downloaded and executed simply by visiting a compromised website-often through malicious advertising scripts (malvertising). According to SCAZT Section 4: Application and Data Security (Pages 85-87), ad blockers help prevent drive-by downloads by blocking these third-party ad scripts and redirections, which are commonly used in such attacks.

VPNs and private browsing modes (e.g., Incognito) do not provide protection against malicious content hosted on web pages. Reference: Designing and Implementing Secure Cloud Access for Users and Endpoints (SCAZT), Section 4, Pages 85-87
