

Reliable and Guarantee Refund of CompTIA XK0-005 Practice Test According to Terms and Conditions

DOWNLOAD the newest DumpsQuestion XK0-005 PDF dumps from Cloud Storage for free: https://drive.google.com/open?id=1Jy_3kPvlnmPEj0I6S8cwxe7ap4btwQhO

In recent, DumpsQuestion began to provide you with the latest exam dumps about IT certification test, such as CompTIA XK0-005 Certification Dumps are developed based on the latest IT certification exam. DumpsQuestion CompTIA XK0-005 certification training dumps will tell you the latest news about the exam. The changes of the exam outline and those new questions that may appear are included in our dumps. So if you want to attend IT certification exam, you'd better make the best of DumpsQuestion questions and answers. Only in this way can you prepare well for the exam.

To give you an idea about the top features of DumpsQuestion CompTIA Linux+ Certification Exam (XK0-005) exam questions, a free demo of DumpsQuestion CompTIA Linux+ Certification Exam (XK0-005) exam dumps is being offered free of cost. Just download DumpsQuestion CompTIA Linux+ Certification Exam (XK0-005) exam questions demo and checks out the top features of DumpsQuestion CompTIA Linux+ Certification Exam (XK0-005) exam dumps. If you feel that DumpsQuestion CompTIA XK0-005 exam questions work for you then buy the full and final DumpsQuestion CompTIA Linux+ Certification Exam (XK0-005) exam dumps at an affordable price and start CompTIA Linux+ Certification Exam (XK0-005) exam preparation.

Free PDF High Pass-Rate CompTIA - XK0-005 - Popular CompTIA Linux+ Certification Exam Exams

The accuracy rate of XK0-005 test training materials of DumpsQuestion is high with wide coverage. It will be the most suitable XK0-005 test training materials and the one you need most to pass XK0-005 exam. We promise that we will provide renewal service freely as long as one year after you purchase our XK0-005 Dumps; if you fail XK0-005 test or there are any quality problem of our XK0-005 exam dumps and training materials, we will give a full refund immediately.

CompTIA Linux+ Certification Exam Sample Questions (Q763-Q768):

NEW QUESTION # 763

A Linux administrator needs to create a new user named user02. However, user02 must be in a different home directory, which is under /comptia/projects.

Which of the following commands will accomplish this task?

- A. `useradd -d /comptia/projects user02`
- B. `useradd -b /comptia/projects user02`
- C. `useradd -s /comptia/projects user02`
- D. `useradd -m /comptia/projects user02`

Answer: A

Explanation:

The command `useradd -d /comptia/projects user02` will accomplish the task of creating a new user named `user02` with a different home directory. The `useradd` command is a tool for creating new user accounts on Linux systems. The `-d` option specifies the home directory for the new user, which is the directory where the user's personal files and settings are stored. The `/comptia/projects` is the path of the home directory for the new user, which is different from the default location of `/home/user02`. The `user02` is the name of the new user. The command `useradd -d /comptia/projects user02` will create a new user named `user02` with a home directory under `/comptia/projects`. This is the correct command to use to accomplish the task. The other options are incorrect because they either do not specify the home directory for the new user (`useradd -m /comptia/projects user02` or `useradd -s /comptia/projects user02`) or do not use the correct option for the home directory (`useradd -b /comptia/projects user02` instead of `useradd -d /comptia/projects user02`).

NEW QUESTION # 764

In order to copy data from another VLAN, a systems administrator wants to temporarily assign IP address `10.0.6.5/24` to the newly added network interface `enp1s0f1`. Which of the following commands should the administrator run to achieve the goal?

- A. `nmcli conn add ipv4.address-10.0.6.5/24 ifname enp1s0f1`
- B. `ifconfig 10.0.6.5/24 enp1s0f1`
- C. `ip addr add 10.0.6.5/24 dev enp1s0f1`
- D. `echo "IPV4_ADDRESS=10.0.6.5/24" > /etc/sysconfig/network-scripts/ifcfg-enp1s0f1`

Answer: C

Explanation:

The command `ip addr add 10.0.6.5/24 dev enp1s0f1` will achieve the goal of temporarily assigning IP address `10.0.6.5/24` to the newly added network interface `enp1s0f1`. The `ip` command is a tool for managing network interfaces and routing on Linux systems. The `addr` option specifies the address manipulation mode. The `add` option adds a new address to an interface. The `10.0.6.5/24` is the IP address and the subnet mask in CIDR notation. The `dev` option specifies the device name. The `enp1s0f1` is the name of the network interface. The command `ip addr add 10.0.6.5/24 dev enp1s0f1` will add the IP address `10.0.6.5/24` to the network interface `enp1s0f1`, which will allow the administrator to copy data from another VLAN.

This is the correct command to use to achieve the goal. The other options are incorrect because they either do not add a new address to an interface (`echo "IPV4_ADDRESS=10.0.6.5/24" > /etc/sysconfig/network-scripts/ifcfg-enp1s0f1` or `ifconfig 10.0.6.5/24 enp1s0f1`) or do not use the correct syntax for the command (`nmcli conn add ipv4.address-10.0.6.5/24 ifname enp1s0f1` instead of `nmcli conn add type ethernet ipv4.address 10.0.6.5/24 ifname enp1s0f1`).

NEW QUESTION # 765

A developer has been unable to remove a particular data folder that a team no longer uses. The developer escalated the issue to the systems administrator. The following output was received:

```
# rmdir data/
rmdir: failed to remove 'data/': Operation not permitted
# rm -rf data/
rm: cannot remove 'data': Operation not permitted
# mv data/ mydata
mv: cannot move 'data/' to 'mydata': Operation not permitted
# cd data/
# cat > test.txt
bash: test.txt: Permission denied
```

Which of the following commands can be used to resolve this issue?

- A. `chattr -R -i data/`
- B. `chgrp -R 755 data/`
- C. `chown -R data/`
- D. `chmod -R 777 data/`

Answer: A

Explanation:

The command that can be used to resolve the issue of being unable to remove a particular data folder is `chattr -R -i data/`. This command will use the `chattr` utility to change file attributes on a Linux file system. The `-R` option means that `chattr` will recursively change attributes of directories and their contents. The `-i` option means that `chattr` will remove (unset) the immutable attribute from files or directories. When a file or directory has the immutable attribute set, it cannot be modified, deleted, or renamed.

NEW QUESTION # 766

A Linux administrator has configured a Linux system to be used as a router. The administrator confirms that two network adapters are properly installed and functioning correctly. In addition, the output of the `iptables -L` command appears to contain a complete firewall configuration.

Which of the following commands does the administrator need to issue for the router to be fully functional?

- A. `echo "1" > /proc/sys/net/ipv4/ip_forward`
- B. `echo "1" > /proc/sys/net/ipv4/ip_default_ttl`
- C. `echo "0" > /proc/sys/net/ipv4/max_connections`
- D. `echo "0" > /proc/sys/net/ipv4/tcp_abort_on_overflow`

Answer: A

NEW QUESTION # 767

A Linux administrator is providing a new Nginx image from the registry to local cache. Which of the following commands would allow this to happen?

- A. `docker pull nginx`
- B. `docker commit nginx`
- C. `docker import nginx`
- D. `docker attach nginx`

Answer: A

Explanation:

Explanation

The command that would allow this to happen is `docker pull nginx`. Docker is a software platform that allows the administrator to create, run, and manage containers on Linux systems. Containers are isolated and lightweight environments that can run applications and services without affecting the host system. Docker uses images to create containers, which are files that contain the code, libraries, dependencies, and configuration of the applications and services. Docker uses a registry to store and distribute images, which is a service that hosts and serves images. Docker Hub is the default public registry that provides a large number of official and community images. Nginx is a popular web server and reverse proxy that can run as a container. The command `docker pull nginx` will download the latest version of the Nginx image from the Docker Hub registry to the local cache, which is the storage location for the images on the host system. This will allow the administrator to provide a new Nginx image from the registry to the local cache. This is the correct command to use to accomplish the task. The other options are incorrect because they either do not download an image from the registry (`docker attach nginx` or `docker commit nginx`) or do not exist (`docker import nginx`).
