Linux Foundation Certified GitOps Associate Sample Questions (Q16-Q21):

NEW QUESTION # 16

Which of these Git commands will enact a rollback of the configuration to a previous commit?

- A. git branch
- B. git revert
- C. git commit
- D. git push

Answer: B

Explanation:

In GitOps, rollback is performed by reverting the system's Desired State stored in Git. This is done with the `git revert` command, which creates a new commit that undoes the changes introduced by a previous commit.

"Because Git provides an immutable history of changes, rollbacks are straightforward. Reverting to a previous configuration is accomplished by reverting the commit in Git, which then allows the reconciler to apply the earlier desired state." Thus, the correct answer is B: `git revert`.

NEW QUESTION # 17

In the context of GitOps, what does Continuous mean?

- A. Reconciliation continues to happen.
- B. Reconciliation only happens once.
- C. Reconciliation must happen instantaneously.
- D. Reconciliation happens only during instantiation.

Answer: A

Explanation:

One of the four core GitOps principles is that the system must be Continuously Reconciled. This means reconciliation is not a one-time or on-demand process but happens constantly in the background, ensuring the actual system state remains aligned with the declared desired state.

"GitOps requires that reconciliation is continuous. Software agents continuously compare actual state against desired state and automatically reconcile differences." Thus, the correct answer is C.

NEW QUESTION # 18

In GitOps, how is the Desired State stored?

- A. In a way that retains only the latest version.
- B. In a way that enforces immutability and versioning.
- C. In a way that permits direct modifications to live systems.

- D. In a way that enforces mutability and versioning.

Answer: B

Explanation:

The GitOps principle of Versioned and Immutable requires Desired State to be stored in a way that enforces immutability and versioning. This ensures every change is recorded, auditable, and reversible.

"Desired state must be kept in an immutable, version-controlled system. This guarantees a full history of changes and enables safe rollbacks." Thus, the correct answer is D.

NEW QUESTION # 19

Which of the following is part of a declaratively defined system?

- A. Both the desired state and the steps to reach the Desired State.
- **B. Only the Desired State.**
- C. Only the steps to reach the Desired State.
- D. Only the code for reaching the Desired State.

Answer: B

Explanation:

In GitOps, systems are defined declaratively. This means that the desired state is described in Git, while the steps to achieve it are not explicitly defined. Instead, reconciliation agents interpret the declarative definition and automatically apply changes as needed.

"A declaratively defined system specifies only the desired state. It does not describe the sequence of steps required to reach that state. The reconciliation process ensures the system converges to the declared state automatically." Therefore, the correct answer is C: Only the Desired State.

References: GitOps Principles (CNCF GitOps Working Group), Principle 1: The system is described declaratively.

NEW QUESTION # 20

Which of the following statements accurately describes the role of GitOps in progressive delivery?

- **A. GitOps allows end users to perform progressive delivery automatically without manually shifting traffic.**
- B. GitOps only works with manual progressive delivery without any automation.
- C. GitOps requires end users to manually shift traffic for progressive delivery.
- D. GitOps does not allow end users to perform progressive delivery automatically, only manually.

Answer: A

Explanation:

Progressive delivery is a GitOps pattern that incrementally rolls out application updates, using methods like canary releases, feature flags, and blue-green deployments. GitOps enhances this by ensuring the rollout is automated and declaratively managed through Git, removing the need for manual traffic switching.

"GitOps enables progressive delivery by declaratively managing rollout strategies such as canary or blue-green deployments. These strategies are applied automatically by controllers, without requiring manual traffic switching." Thus, the correct answer is B.
