## CompTIA Cloud+ (2024) Sample Questions (Q89-Q94):

### NEW QUESTION # 89

A cloud administrator needs to collect process-level, memory-usage tracking for the virtual machines that are part of an autoscaling group. Which of the following is the best way to accomplish the goal by using cloud-native monitoring services?

- A. Scheduling a script to collect the data
- B. Deploying the cloud-monitoring agent software
- C. Configuring page file/swap metrics
- D. Enabling memory monitoring in the VM configuration

**Answer: B**

Explanation:

To collect process-level, memory-usage tracking for virtual machines, deploying cloud-monitoring agent software is the best approach. The agent can gather detailed system metrics and send them to the cloud-native monitoring services for analysis and visualization. ### NEW QUESTION # 90

A cloud engineer wants to deploy a new application to the cloud and is writing the following script:

```
terraform {
  required_providers {
    cloud_provider1 = {
      source = "hashicorp/cloud_provider1"
      version = "~> 4.16"
    }
  }
  required_version = ">= 1.2.0"
}
provider "cloud_provider1" {
  region = "us-west-2"
}
resource "server_instance" "app_server" {
  ami = "ami-830c94e3"
  instance_type = "t2.micro"
  tags = {
    Name = "AppServerInstance"
  }
}
```

Which of the following actions will this script perform?

- A. Create a new cloud resource.
- B. Upload a new VM image.
- C. Import a cloud module.
- D. Build a local server.

**Answer: A**

Explanation:

The script shown is written in Terraform, which is an infrastructure as code (IaC) tool used for building, changing, and versioning infrastructure safely and efficiently. This particular Terraform script specifies a required provider and its version, the Terraform version, sets the cloud provider's region, and then defines a resource for a server instance with a specific AMI ID and instance type. It also includes tags for the instance. The action this script will perform is to create a new cloud resource, specifically a server

instance on the cloud provider's platform. Reference: CompTIA Cloud+ Study Guide (Exam CV0-004) by Todd Montgomery and Stephen Olson

#### NEW QUESTION # 91

A newly configured VM fails to run application updates despite having internet access. The updates download automatically from a third-party network. Given the following output:

```
$dig +short apac.updateserver.net
38.102.218.7
$dig +short na.updateserver.net
request timeout
```

Which of the following troubleshooting steps would be best to take?

- **A. Checking DNS configurations**
- B. Testing the IP address configuration
- C. Reconfiguring routing protocols
- D. Running a trace to the router

**Answer: A**

Explanation:

The best troubleshooting step to take given the output is to check DNS configurations. The failure to resolve the "na.updateserver.net" domain suggests a DNS resolution issue, which could be due to incorrect DNS settings, a failure in the DNS service, or an issue with the DNS server itself.

Troubleshooting DNS issues is a crucial skill in cloud management, as DNS plays a fundamental role in network connectivity and access to resources. It is covered under Cloud Concepts in the CompTIA Cloud+ curriculum.

#### NEW QUESTION # 92

A company is required to save historical data for seven years. A cloud administrator implements a script that automatically deletes data older than seven years. Which of the following concepts best describes why the historical data is being deleted?

- A. Tiered storage for archiving
- B. Cost implications
- C. Data loss prevention
- **D. End of life**

**Answer: D**

Explanation:

Deleting historical data older than seven years as described is an example of data end of life (EOL) policies in action. These policies dictate when data is no longer needed or relevant and should be securely disposed of, often for compliance, legal, or cost-saving reasons.

#### NEW QUESTION # 93

A cloud developer is creating a static website that customers will be accessing globally. Which of the following services will help reduce latency?

- A. VPC
- **B. CDN**
- C. API gateway
- D. Application load balancer

**Answer: B**

Explanation:

A Content Delivery Network (CDN) is the service that will help reduce latency for a static website accessed globally. CDNs distribute content across multiple geographically dispersed servers, allowing users to connect to a server that is closer to them.

thereby reducing the time it takes to load the website.
