

# Reliable GH-500 Exam Sample - GH-500 Valid Exam Discount

BONUS!!! Download part of RealVCE GH-500 dumps for free: [https://drive.google.com/open?id=16pjFa\\_mW7V56LxEolvZposQMS\\_LFCvzi](https://drive.google.com/open?id=16pjFa_mW7V56LxEolvZposQMS_LFCvzi)

Our GitHub Advanced Security prep torrent will provide customers with three different versions, including the PDF version, the software version and the online version, each of them has its own advantages. Now I am going to introduce you the PDF version of GH-500 test braindumps which are very convenient. It is well known to us that the PDF version is very convenient and practical. The PDF version of our GH-500 Test Braindumps provide demo for customers; you will have the right to download the demo for free if you choose to use the PDF version.

## Microsoft GH-500 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Configure and use Dependabot and Dependency Review: Focused on Software Engineers and Vulnerability Management Specialists, this section describes tools for managing vulnerabilities in dependencies. Candidates learn about the dependency graph and how it is generated, the concept and format of the Software Bill of Materials (SBOM), definitions of dependency vulnerabilities, Dependabot alerts and security updates, and Dependency Review functionality. It covers how alerts are generated based on the dependency graph and GitHub Advisory Database, differences between Dependabot and Dependency Review, enabling and configuring these tools in private repositories and organizations, default alert settings, required permissions, creating Dependabot configuration files and rules to auto-dismiss alerts, setting up Dependency Review workflows including license checks and severity thresholds, configuring notifications, identifying vulnerabilities from alerts and pull requests, enabling security updates, and taking remediation actions including testing and merging pull requests.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>Configure and use secret scanning: This domain targets DevOps Engineers and Security Analysts with the skills to configure and manage secret scanning. It includes understanding what secret scanning is and its push protection capability to prevent secret leaks. Candidates differentiate secret scanning availability in public versus private repositories, enable scanning in private repos, and learn how to respond appropriately to alerts. The domain covers alert generation criteria for secrets, user role-based alert visibility and notification, customizing default scanning behavior, assigning alert recipients beyond admins, excluding files from scans, and enabling custom secret scanning within repositories.</li></ul>

Topic 3	<ul style="list-style-type: none"> <li>Describe the GHAS security features and functionality: This section of the exam measures skills of Security Engineers and Software Developers and covers understanding the role of GitHub Advanced Security (GHAS) features within the overall security ecosystem. Candidates learn to differentiate security features available automatically for open source projects versus those unlocked when GHAS is paired with GitHub Enterprise Cloud (GHEC) or GitHub Enterprise Server (GHEs). The domain includes knowledge of Security Overview dashboards, the distinctions between secret scanning and code scanning, and how secret scanning, code scanning, and Dependabot work together to secure the software development lifecycle. It also covers scenarios contrasting isolated security reviews with integrated security throughout the development lifecycle, how vulnerable dependencies are detected using manifests and vulnerability databases, appropriate responses to alerts, the risks of ignoring alerts, developer responsibilities for alerts, access management for viewing alerts, and the placement of Dependabot alerts in the development process.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>Describe GitHub Advanced Security best practices, results, and how to take corrective measures: This section evaluates skills of Security Managers and Development Team Leads in effectively handling GHAS results and applying best practices. It includes using Common Vulnerabilities and Exposures (CVE) and Common Weakness Enumeration (CWE) identifiers to describe alerts and suggest remediation, decision-making processes for closing or dismissing alerts including documentation and data-based decisions, understanding default CodeQL query suites, how CodeQL analyzes compiled versus interpreted languages, the roles and responsibilities of development and security teams in workflows, adjusting severity thresholds for code scanning pull request status checks, prioritizing secret scanning remediation with filters, enforcing CodeQL and Dependency Review workflows via repository rulesets, and configuring code scanning, secret scanning, and dependency analysis to detect and remediate vulnerabilities earlier in the development lifecycle, such as during pull requests or by enabling push protection.</li> </ul>
Topic 5	<ul style="list-style-type: none"> <li>Configure and use Code Scanning with CodeQL: This domain measures skills of Application Security Analysts and DevSecOps Engineers in code scanning using both CodeQL and third-party tools. It covers enabling code scanning, the role of code scanning in the development lifecycle, differences between enabling CodeQL versus third-party analysis, implementing CodeQL in GitHub Actions workflows versus other CI tools, uploading SARIF results, configuring workflow frequency and triggering events, editing workflow templates for active repositories, viewing CodeQL scan results, troubleshooting workflow failures and customizing configurations, analyzing data flows through code, interpreting code scanning alerts with linked documentation, deciding when to dismiss alerts, understanding CodeQL limitations related to compilation and language support, and defining SARIF categories.</li> </ul>

## Specifications of RealVCE Microsoft GH-500 Exam Preparation Material

The site of RealVCE is well-known on a global scale. Because the training materials it provides to the IT industry have no-limited applicability. This is the achievement made by IT experts in RealVCE after a long period of time. They used their knowledge and experience as well as the ever-changing IT industry to produce the material. The effect of RealVCE's Microsoft GH-500 Exam Training materials is reflected particularly good by the use of the many candidates. If you participate in the IT exam, you should not hesitate to choose RealVCE's Microsoft GH-500 exam training materials. After you use, you will know that it is really good.

## Microsoft GitHub Advanced Security Sample Questions (Q44-Q49):

### NEW QUESTION # 44

Which of the following features helps to prioritize secret scanning alerts that present an immediate risk?

- A. Secret validation
- B. Push protection
- C. Custom pattern dry runs
- D. Non-provider patterns

**Answer: A**

Explanation:

Secret validation checks whether a secret found in your repository is still valid and active with the issuing provider (e.g., AWS, GitHub, Stripe). If a secret is confirmed to be active, the alert is marked as verified, which means it's considered a high-priority issue because it presents an immediate security risk.

This helps teams respond faster to valid, exploitable secrets rather than wasting time on expired or fake tokens.

#### NEW QUESTION # 45

Which patterns are secret scanning validity checks available to?

- A. Partner patterns
- B. Custom patterns
- C. Push protection patterns
- D. High entropy strings

**Answer: A**

Explanation:

Validity checks - where GitHub verifies if a secret is still active - are available for partner patterns only. These are secrets issued by GitHub's trusted partners (like AWS, Slack, etc.) and have APIs for GitHub to validate token activity status.

Custom patterns and high entropy patterns do not support automated validity checks.

#### NEW QUESTION # 46

Which of the following options would close a Dependabot alert?

- A. Creating a pull request to resolve the vulnerability that will be approved and merged
- B. Viewing the Dependabot alert on the Dependabot alerts tab of your repository
- C. Viewing the dependency graph
- D. Leaving the repository in its current state

**Answer: A**

Explanation:

A Dependabot alert is only marked as resolved when the related vulnerability is no longer present in your code - specifically after you merge a pull request that updates the vulnerable dependency.

Simply viewing alerts or graphs does not affect their status. Ignoring the alert by leaving the repo unchanged keeps the vulnerability active and unresolved.

#### NEW QUESTION # 47

What do you need to do before you can define a custom pattern for a repository?

- A. Enable secret scanning on the repository.
- B. Add a secret scanning custom pattern.
- C. Provide match requirements for the secret format.
- D. Provide a regular expression for the format of your secret pattern.

**Answer: A**

Explanation:

Stack Overflow

Explanation:

Comprehensive and Detailed Explanation:

Before defining a custom pattern for secret scanning in a repository, you must enable secret scanning for that repository. Secret scanning must be active to utilize custom patterns, which allow you to define specific formats (using regular expressions) for secrets unique to your organization.

Once secret scanning is enabled, you can add custom patterns to detect and prevent the exposure of sensitive information tailored to your needs.

## NEW QUESTION # 48

What is the purpose of the SECURITY.md file in a GitHub repository?

- A. contributing.md
- B. support.md
- **C. security.md**
- D. readme.md

**Answer: C**

### Explanation:

The correct place to look is the SECURITY.md file. This file provides contributors and security researchers with instructions on how to responsibly report vulnerabilities. It may include contact methods, preferred communication channels (e.g., security team email), and disclosure guidelines.

This file is considered a GitHub best practice and, when present, activates a "Report a vulnerability" button in the repository's Security tab.

## NEW QUESTION # 49

Your privacy and personal right are protected by our company and corresponding laws and regulations on our GH-500 study guide. Whether you are purchasing our GH-500 training questions, installing or using them, we won't give away your information to other platforms, and the whole transaction process will be open and transparent. Therefore, let us be your long-term partner and we promise our GH-500 Preparation exam won't let down.
