Nowadays, everyone lives so busy every day, and we believe that you are no exception. If you want to save your time, it will be the best choice for you to buy our Integration-Architect study torrent. Because the greatest advantage of our study materials is the high effectiveness. As a powerful tool for a lot of workers to walk forward a higher self-improvement, PassLeaderVCE continue to pursue our passion for advanced performance and human-centric technology. We aimed to help some candidates who have trouble in pass their Integration-Architect Exam and only need few hours can grasp all content of the exam. In recent years, our test torrent has been well received and have reached 99% pass rate with all our dedication.

In this way, the Salesforce Integration-Architect certified professionals can not only validate their skills and knowledge level but also put their careers on the right track. By doing this you can achieve your career objectives. To avail of all these benefits you need to pass the Integration-Architect Exam which is a difficult exam that demands firm commitment and complete Integration-Architect exam questions preparation.

Valid Salesforce Integration-Architect Dumps | Integration-Architect Valid Dumps Ebook

It is of great importance to consolidate all key knowledge points of the Integration-Architect exam. It is difficult for you to summarize by yourself. It is a complicated and boring process. We will collect all relevant reference books of the Integration-Architect exam written by famous authors from the official website. And it is not easy and will cost a lot of time and efforts. At the same time, it is difficult to follow and trace the changes of the Integration-Architect Exam, but our professional experts are good at this for you. Just buy our Integration-Architect study materials, you will succeed easily!

Salesforce Certified Integration Architect Sample Questions (Q10-Q15):

NEW QUESTION # 10

Northern Trail Outfitters needs to present shipping costs and estimated delivery times to their customers. Shipping services used vary by region, and have similar but distinct service request parameters. Which integration component capability should be used?

- A. Enterprise Service Bus to determine which shipping service to use, and transform requests to the necessary format.
- B. Enterprise Service Bus user interface to collect shipper-specific form data.
- C. Outbound Messaging to request costs and delivery times from Shipper delivery services with automated error retry.
- D. APEX REST Service to implement routing logic to the various shipping service.

Answer: A

Explanation:

Using an Enterprise Service Bus (ESB) to determine which shipping service to use, and transform requests to the necessary format is a good solution because it can provide routing, transformation, mediation, and orchestration capabilities for integrating different services. An ESB can also abstract the complexity and heterogeneity of the services from the client application, which simplifies the integration. Using Outbound Messaging to request costs and delivery times from Shipper delivery services with automated error retry is not a good solution because Outbound Messaging is a Salesforce-specific feature that uses SOAP web services, which may not be compatible with all shipping services. Using APEX REST Service to implement routing logic to the various shipping service is also not a good solution because it can introduce performance and scalability issues, as well as increase the maintenance cost and complexity of the code. Using Enterprise Service Bus user interface to collect shipper-specific form data is not a valid option because an ESB does not have a user interface component. NEW QUESTION # 11

Universal Containers (UC) is a global financial company. UC support agents would like to open bank accounts on the spot for a customer who is inquiring about UC products.

During opening the bank account process, the agents execute credit checks for the customers through external agencies. At a given time, up to 30 concurrent requests will be using the service for performing credit checks for customers.

What error handling mechanisms should be built to display an error to the agent when the credit verification process failed?

- A. Handle integration errors in the middleware in case the verification process is down, then the middleware should retry processing the request multiple times.
- B. In case the verification process is down, use fire and forget mechanism instead of request and reply to allow the agent to get the response back when the service is back online.
- C. In case the verification process is down, Use mock service to send the response to the agent.
- **D. Handle verification process error in the Verification Webservice API in case there is a connection issue to the Webservice if it responds with an error.**

Answer: D

Explanation:

Explanation

Handle verification process error in the Verification Webservice API in case there is a connection issue to the Webservice or if it responds with an error. This solution ensures that the agent can see an error message when the credit verification process failed, and take appropriate actions. The Verification Webservice API can implement error handling logic to catch any exceptions or errors that occur during the callout to the external agencies, and return a meaningful error message to the agent. The agent can then retry the verification process, or escalate the issue to a supervisor. References: Certification - Integration Architect - Trailhead, [Apex Web Services and Callouts]

NEW QUESTION # 12

Universal Containers (UC) currently owns a middleware tool and they have developed an API-led integration architecture with three API tiers. The first-tier interfaces directly with the systems of engagement, the second tier implements business logic and aggregates data, while the third-tier interfaces directly with systems of record. Some of the systems of engagement will be a mobile application, a web application, and Salesforce.

UC has a business requirement to return data to the systems of engagement in different formats while also enforcing different security protocols.

What should an Integration Architect recommend to meet these requirements?

- A. Leverage an Identity Provider solution that communicates with the API tiers via SAML
- B. Implement an API gateway that all systems of engagement must interface with first.
- **C. Enforce separate security protocols and return formats at the first tier of the API-led architecture.**
- D. Enforce separate security protocols and return formats at the second tier of the API-led architecture.

Answer: C

Explanation:

Explanation

The integration architect should recommend enforcing separate security protocols and return formats at the first tier of the API-led architecture. The first tier is also known as the experience layer, which is responsible for providing a tailored interface for each system of engagement. By enforcing security and format at this layer, the integration architect can ensure that each system of

engagement can access the data in a secure and consistent way, without affecting the other layers.

NEW QUESTION # 13

Northern Trail Outfitters (NTO) has recently implemented middleware for orchestration of services across platforms. The ERP system being used requires transactions be captured near real time at a REST endpoint initiated in Salesforce when creating an order object. Additionally, the Salesforce team has limited development resources and requires a low code solution.

Which two options will fulfill the use case requirements?

Choose 2 answers

- A. Use a process builder to create a Platform Event, selecting the record type as the Platform Event Name on insert of record.
- B. Implement a Workflow Rule with Outbound Messaging to send SOAP messages to the designated endpoint.
- C. Use Remote Process Invocation fire and forget pattern on insert on the order object using Flow Builder.
- D. Implement Change Data Capture on the order object and leverage the replay Id in the middleware solution.

Answer: C,D

NEW QUESTION # 14

Northern Trail Outfitters wants to improve the quality of call-outs from Salesforce to their REST APIs. For this purpose, they will require all API clients/consumers to adhere to RESTAPI Markup Language (RAML) specifications that include field-level definition of every API request and response payload. RAML specs serve as interface contracts that Apex REST API Clients can rely on. Which two design specifications should the Integration Architect include in the integration architecture to ensure that ApexREST API Clients unit tests confirm adherence to the RAML specs?

Choose 2 answers

- A. Call the HttpCalloutMock implementation from the Apex REST API Clients.
- B. Implement HttpCalloutMock to return responses per RAML specification.
- C. Call the Apex REST API Clients in a test context to get the mock response.
- D. Require the Apex REST API Clients to implement the HttpCalloutMock.

Answer: B,C

Explanation:

Explanation

The HttpCalloutMock interface allows testing HTTP callouts by returning a predefined response in a test context.

By implementing HttpCalloutMock to return responses per RAML specification, the Apex REST API Clients unit tests can confirm that the API requests and responses match the expected format and values.

Calling the Apex REST API Clients in a test context to get the mock response is also necessary to verify the adherence to the RAML specs. Calling the HttpCalloutMock implementation from the Apex REST API Clients or requiring the Apex REST API Clients to implement the HttpCalloutMock are not valid options because the HttpCalloutMock interface is implemented by a separate class that is passed as a parameter to the Test.setMock method2 References: 1: Idempotent REST APIs 2: Testing HTTP Callouts by Implementing the HttpCalloutMock Interface

NEW QUESTION # 15

.....

Our Desktop version is an application software that runs without an internet connection. It helps you to test yourself by giving the Salesforce Certified Integration Architect (Integration-Architect) practice test. Our desktop version also keeps a record of your previous performance and it shows the improvement in your next Integration-Architect Practice Exam. With the help of PassLeaderVCE Salesforce Certified Integration Architect (Integration-Architect) exam questions, you will be able to pass the Salesforce Integration-Architect certification exam with ease. When you invest in our product it will surely benefit your Salesforce Certified Integration Architect (Integration-Architect) exam dumps.
