

Reliable ISACA CDPSE Test Questions & New CDPSE Test Price

P.S. Free & New CDPSE dumps are available on Google Drive shared by itPass4sure: https://drive.google.com/open?id=1ihPv1APhFmQkV3i__1zBgtu6N_DSsol0

The optimization of CDPSE training questions is very much in need of your opinion. If you find any problems during use, you can give us feedback. We will give you some benefits as a thank you. You will get a chance to update the system of CDPSE Real Exam for free. Of course, we really hope that you can make some good suggestions after using our CDPSE study materials. We hope to grow with you and help you get more success in your life.

Isaca CDPSE Certification Exam - A quick overview

CDPSE Exam is a sought-after certification exam in the IT industry. It is also known as Certified Data Privacy Solutions Engineer. This certification exam is authorized by the International Society for Information Risk and Compliance (ISARC) and is offered by Isaca Training Institute. The exam is a certification exam that aims to validate the technical skills and knowledge it takes to assess, build and implement comprehensive privacy solutions. Implement cisco enterprise network solutions. The answers to these questions help to validate the candidate's skills and understanding of Privacy Solutions. **CDPSE Dumps** can help you pass this exam on your first attempt.

Candidates who pass the CDPSE Exam can fill the gap with technical privacy skills so that the organization has competent privacy technologists to build and implement solutions that enhance efficiency and mitigate risk. Candidates who have passed the CDPSE Exam can be considered for employment opportunities in ISACA as a Professional in Risk Assurance and Information Security. The exam will certify the understanding and skills of a professional in information privacy. Understanding in hop redundancy protocols, logical security, and physical security. The majority of students are glad to decide to pursue this certification as it will help them to get a better job.

Famous CDPSE Training Brain Dumps present the most useful Exam Materials - itPass4sure

Don't need a lot of time and money, only 30 hours of special training, and you can easily pass your first time to attend ISACA Certification CDPSE Exam. itPass4sure are able to provide you with test exercises which are closely similar with real exam questions.

ISACA Certified Data Privacy Solutions Engineer Sample Questions (Q111-Q116):

NEW QUESTION # 111

Which of the following is the BEST way to limit the organization's potential exposure in the event of consumer data loss while maintaining the traceability of the data?

- **A. De-identify the data.**
- B. Require a digital signature.
- C. Use a unique hashing algorithm.
- D. Encrypt the data at rest.

Answer: A

Explanation:

Explanation

De-identification is a technique that removes or modifies direct and indirect identifiers in a data set to prevent or limit the identification of the data subjects. De-identification reduces the risk of re-identification and thus limits the organization's potential exposure in the event of consumer data loss. De-identification also maintains the traceability of the data by preserving some characteristics or patterns of the original data that can be used for analysis or research purposes. The other options are not effective ways to limit exposure and maintain traceability¹, p. 75-76 References: 1: CDPSE Review Manual (Digital Version)

NEW QUESTION # 112

A project manager for a new data collection system had a privacy impact assessment (PIA) completed before the solution was designed. Once the system was released into production, an audit revealed personal data was being collected that was not part of the PIA. What is the BEST way to avoid this situation in the future?

- A. Conduct a privacy post-implementation review.
- B. Document personal data workflows in the product life cycle
- **C. Incorporate privacy checkpoints into the secure development life cycle**
- D. Require management approval of changes to system architecture design.

Answer: C

Explanation:

Explanation

Incorporating privacy checkpoints into the secure development life cycle (SDLC) is the best way to avoid collecting personal data that was not part of the privacy impact assessment (PIA). Privacy checkpoints are stages in the SDLC where privacy requirements and risks are reviewed and validated, and any changes or deviations from the original PIA are identified and addressed. Privacy checkpoints help ensure that privacy is embedded throughout the system design and development, and that any changes are documented and approved.

NEW QUESTION # 113

An organization's work-from-home policy allows employees to access corporate IT assets remotely. Which of the following controls is MOST important to mitigate the risk of potential personal data compromise?

- A. Firewall rules review
- **B. Encryption of network traffic**
- C. Intrusion detection system (IDS)
- D. Intrusion prevention system (IPS)

Answer: B

Explanation:

Encryption of network traffic is the most important control to mitigate the risk of potential personal data compromise when employees access corporate IT assets remotely. Encryption is a process that transforms data into an unreadable form, making it difficult for unauthorized parties to intercept, modify, or steal it. Encryption of network traffic ensures that the data transmitted between the remote employees and the corporate network is protected from eavesdropping, tampering, or leakage.

Intrusion prevention system (IPS), firewall rules review, and intrusion detection system (IDS) are also useful controls for network security, but they are not as effective as encryption for protecting personal data in transit. IPS and IDS can monitor and block

malicious or suspicious network traffic, but they cannot prevent data exposure if the traffic is intercepted by a third party. Firewall rules review can help optimize and secure the firewall configuration, but it cannot guarantee that the firewall will not be bypassed or compromised by an attacker. Therefore, encryption of network traffic is the best option among the choices given.

NEW QUESTION # 114

Which of the following should be established FIRST before authorizing remote access to a data store containing personal data?

- A. Multi-factor authentication
- B. Network security standard
- C. Privacy policy
- D. Virtual private network (VPN)

Answer: D

Explanation:

A virtual private network (VPN) is a technology that creates a secure and encrypted connection over a public network, such as the internet. A VPN should be established first before authorizing remote access to a data store containing personal data, as it protects the data from unauthorized interception, modification, or disclosure by third parties. A VPN also helps to ensure the identity and authenticity of the remote users and devices accessing the data store. Reference: 2 Domain 2, Task 8

NEW QUESTION # 115

Which of the following is the BEST method to ensure the security of encryption keys when transferring data containing personal information between cloud applications?

- A. Whole disk encryption
- B. Digital signature
- C. Asymmetric encryption
- D. Symmetric encryption

Answer: C

Explanation:

Explanation

Asymmetric encryption is a method of encrypting and decrypting data using two different keys: a public key and a private key. The public key can be shared with anyone, while the private key is kept secret by the owner.

Data encrypted with the public key can only be decrypted with the private key, and vice versa. Asymmetric encryption ensures the security of encryption keys when transferring data containing personal information between cloud applications, by providing the following benefits:

* It can prevent unauthorized access or use of the data, as only the intended recipient who has the matching private key can decrypt the data sent by the sender who has the public key.

* It can prevent man-in-the-middle attacks, where an attacker intercepts and modifies the data or keys in transit, as any tampering with the data or keys will result in decryption failure or error.

* It can enable digital signatures, where the sender encrypts a message digest of the data with their private key, and the recipient verifies it with the sender's public key. Digital signatures can ensure the authenticity and integrity of the data and the sender.

The other options are less effective or irrelevant for ensuring the security of encryption keys when transferring data containing personal information between cloud applications. Whole disk encryption is a method of encrypting all the data on a disk or device, such as a laptop or a smartphone. It does not protect the data when they are transferred over a network or stored on a cloud server.

Symmetric encryption is a method of encrypting and decrypting data using the same key. It requires both parties to securely exchange and store the key, which may be difficult or risky in a cloud environment. Digital signature is not a method of encryption, but an application of asymmetric encryption that can provide additional security features for data transmission.

NEW QUESTION # 116

.....

When we get into the job, our CDPSE training materials may bring you a bright career prospect. Companies need employees who can create more value for the company, but your ability to work directly proves your value. Our CDPSE certification guide can help you improve your ability to work in the shortest amount of time, for more promotion opportunities and space for development.

Believe it or not that up to you, our CDPSE Training Materials are powerful and useful, it can solve all your stress and difficulties in reviewing the CDPSE exams.
