Fortinet NSE 7 - LAN Edge 7.0 Sample Questions (Q52-Q57):

NEW QUESTION # 52
Which CLI command should an administrator use on FortiGate to view the RSSO authentication process in real time?

- A. diagnose debug application radiusd -1
- B. diagnose debug application authd -1
- C. diagnose debug application foauthd -1
- D. diagnose debug application fnbamd -1

Answer: D

NEW QUESTION # 53
Refer to the exhibit.

Edit Security Policies

Name	Port-Security
Security mode	Port-based **MAC-based**

	Wired-User FAC-Lab ✕
	1 Entry Selected
Guest VLAN	🔵 🔴 onboarding ⌄
Guest authentication delay second(s)	30 ↕

Override RADIUS timeout	⚪

Examine the FortiSwitch security policy shown in the exhibit

If the security profile shown in the exhibit is assigned to all ports on a FortiSwitch device for 802 1X authentication which statement about the switch is correct?

- A. FortiSwitch will assign non-802 1X devices to the onboarding VLAN
- B. FortiSwitch will try to authenticate non-802 1X devices using the device MAC address as the username and password
- C. All EAP messages will be terminated on FortiSwitch
- D. FortiSwitch cannot authenticate multiple devices connected to the same port

Answer: A

Explanation:
According to the FortiSwitch Administration Guide, "If a device does not support 802.1X authentication, you can configure the switch to assign the device to an onboarding VLAN. The onboarding VLAN is a separate VLAN that you can use to provide limited network access to non-802.1X devices." Therefore, option C is true because it describes the behavior of FortiSwitch when the security profile shown in the exhibit is assigned to all ports. Option A is false because FortiSwitch can authenticate multiple devices connected to the same port using MAC-based or MAB-EAP modes. Option B is false because FortiSwitch will not try to authenticate non-802.1X devices using the device MAC address as the username and password, but rather use MAC authentication bypass (MAB) or EAP pass-through modes. Option D is false because all EAP messages will be terminated on FortiGate, not FortiSwitch, when using 802.1X authentication.

NEW QUESTION # 54
Refer to the exhibit. In the wireless configuration shown in the exhibits, an AP is deployed in a remote site and has a wireless network (VAP) called Corporate deployed to it. The network is a tunneled network however clients connecting to a wireless network require access to a local printer. Clients are trying to print to a printer on the remote site but are unable to do so.
Which configuration change is required to allow clients connected to the Corporate SSID to print locally?

Exhibit

```
config wireless-controller wtp-profile

            set max-distance 0        next
config wireless-controller vap
    edit "Corporate"
        set ssid "Corporate"
        set passphrase ENC XXXX
        set schedule "always"
        set quarantine disable
    next
end
```

- A. Configure split-tunneling in the vap configuration
- B. Configure the printer as a wireless client on the Corporate wireless network
- C. Disable the Block Intra-SSID Traffic (intra-vap-privacy) setting on the SSID (VAP) profile
- D. Configure split-tunneling in the wtp-profile configuration

Answer: A

Explanation:
Split tunneling allows you to specify which traffic is tunneled to the FortiGate and which traffic is sent directly to the Internet. This can improve performance and reduce bandwidth usage.
Therefore, by configuring split-tunneling in the vap configuration, you can allow the clients connected to the Corporate SSID to access both the corporate network and the local printer.
