Sharing-and-Visibility-Architect Practice Exam Online, Exam Sharing-and-Visibility-Architect Registration

As practice makes perfect, we offer three different formats of Salesforce Sharing-and-Visibility-Architect exam study material to practice and prepare for the Salesforce Certified Sharing and Visibility Architect (Sharing-and-Visibility-Architect) exam. Our Salesforce Sharing-and-Visibility-Architect practice test simulates the real Sharing-and-Visibility-Architect exam and helps applicants kill exam anxiety. These Sharing-and-Visibility-Architect practice exams provide candidates with an accurate assessment of their readiness for the Sharing-and-Visibility-Architect test.

To prepare for the Salesforce Certified Sharing and Visibility Architect exam, you need to have hands-on experience in managing data security and sharing settings in Salesforce. You should also have a solid understanding of Salesforce architecture, data modeling, and data management principles. There are several resources available to help you prepare for the exam, including official Salesforce training courses, study guides, and practice exams.

Salesforce Certified Sharing and Visibility Architect Sample Questions (Q59-Q64):

NEW QUESTION # 59

Universal Containers (UC) operates worldwide with offices in more than 100 regions in 10 different countries and has established a

very complex role hierarchy to control data visibility. In the new fiscal year UC is planning to reorganize the roles and reassign accounts owners.

Which three features could an architect recommend to avoid problems on this operation? Choose 3 answers

- A. Skinny table
- B. Partition data using Divisions
- C. Granular Locking
- D. Deferred Sharing Recalculation
- E. Parallel Sharing Rule recalculation

Answer: C,D,E

Explanation:

Explanation

Deferred Sharing Recalculation allows the admin to postpone the recalculation of sharing rules until a later time, which can improve performance and avoid locking issues when changing role hierarchy or ownership.

Parallel Sharing Rule Recalculation allows the admin to run multiple sharing rule recalculations at the same time, which can also improve performance and reduce downtime. Granular Locking enables finer-grained locking for certain operations that affect large data sets, such as bulk loading or updating. These features can help avoid problems when reorganizing roles and reassigning account owners. Therefore, the answer B, C, and E are correct and the other options are incorrect

NEW QUESTION # 60

An architect has a requirement to create a criteria-based sharing rule based on the customer Social Security Number. However, when setting up the rule in Contact Sharing, the field is not shown on the list of available fields. What is causing this issue?

- A. The field has been configured for encryption.
- B. The architect does not have permission to Compliance fields.
- C. The architect's profile does not have Field Level Security for this field.

Answer: A

NEW QUESTION # 61

Universal containers (UC) service reps are assigned to a profile which has View All in Case object (Private OWD). To make sure service reps have access to all relevant information to attend to customer requests, Which two details should Salesforce Architects consider? Choose 2 answers:

- A. Service reps will be able to access all UC contact records if they are controlled by parent.
- B. Service reps will not be able to access all UC contact records if they are controlled by parent.
- C. Service reps will not be able to access all the UC Account records because Account OWD is private.
- D. Service reps will be able to access all the UC Account records due to Implicit Sharing.

Answer: B,C

Explanation:

Explanation

Service reps will not be able to access all UC contact records if they are controlled by parent and service reps will not be able to access all UC account records because account OWD is private are two details that Salesforce Architects should consider in this scenario. Since service reps are assigned to a profile which has View All in Case object (Private OWD), they can access all case records regardless of ownership or sharing rules. However, this does not grant them access to related contact or account records, unless they have View All or Modify All permissions on those objects as well. If contact records are controlled by parent (account), their sharing settings will depend on the account OWD and sharing rules. If account OWD is private, service reps will only be able to access account records that they own or are shared with them. Implicit sharing does not apply to internal users. Option A and C are incorrect, since service reps will not be able to access all UC contact or account records due to the reasons explained above.

NEW QUESTION # 62

Universal Containers (UC) delivers training in 500 different regions. The UC operations users team manages course setup, scheduling, and trainer setup. The team members work at a regional level and report to an operations manager. The operations

manager requested access to edit ALL scheduled courses owned by the operations users team.
How should this be achieved?

- **A. The operations manager will get access to the scheduled courses owned by the operations users team defined in the Role Hierarchy.**
- B. The operations manager will get access to the scheduled courses by creating an ownership-based sharing rule and share the scheduled courses with the operations manager.
- C. The operations manager will get access to the scheduled courses by creating a public group, and add the operations manager and the operations users team to the public group.

Answer: A

Explanation:

In Salesforce, the Role Hierarchy grants record access to users higher in the hierarchy. If the operations users are below the operations manager in the Role Hierarchy and the object's organization-wide default (OWD) is not "Private," the manager will inherit access to records owned by their subordinates. This approach is automatic and does not require additional sharing rules or groups.

* Option A: Ownership-based sharing rules are unnecessary if the Role Hierarchy provides the required access.

* Option C: Using a Public Group is an unnecessary workaround for this scenario when Role Hierarchy fulfills the requirement.

* Role Hierarchy Overview

NEW QUESTION # 63

A developer at Universal Container is building an integration within a managed package for their internal org that requires login to an external system. The end point requires basic authentication. The Architect would like to ensure that the username and password are managed securely. Which three options should the Architect recommend to secure the credentials?

- **A. Store the credentials in protected custom settings that are used in the apex callout**
- B. Store the credentials in the apex code, which will not be available to non-admins
- C. Store the credentials in a custom object using encrypted fields
- **D. Store the credentials in protected custom metadata that are used in the apex callout**
- **E. Store the credentials in named credentials that are used in the apex callout**

Answer: A,D,E

NEW QUESTION # 64

.....

Another great way to assess readiness is the Sharing-and-Visibility-Architect web-based practice test. This is one of the trusted online Salesforce Sharing-and-Visibility-Architect prep materials to strengthen your concepts. All specs of the desktop software are present in the web-based Salesforce Sharing-and-Visibility-Architect Practice Exam.
