100% Pass 2025 Efficient Ping Identity PAP-001: Reliable Study Certified Professional - PingAccess Questions

Getting PAP-001 exam certified is not easy. To pass the exam, one must put in a tremendous amount of effort, resolve, and

dedication. One of the most dependable sites, Pass4training provides students with accurate, dependable, and simple Ping Identity PAP-001 Dumps to assure their success on the first attempt. For those looking to pass the PAP-001 exam certificate on their first attempt, Pass4training provides the full package, which includes all exam dumps that follow the syllabus.

Ping Identity Certified Professional - PingAccess Sample Questions (Q26-Q31):

NEW QUESTION # 26

Where in the administrative console should an administrator make user attributes available as HTTP request headers?

- A. HTTP Requests
- **B. Identity Mappings**
- C. Web Sessions
- D. Site Authenticators

Answer: B

Explanation:

PingAccess uses Identity Mappings to take identity attributes provided by the authentication source (e.g., PingFederate, OpenID Connect) and map them into HTTP request headers for back-end applications.

Exact Extract:

"An identity mapping allows you to map identity attributes from the user's session to HTTP headers, cookies, or query parameters that are then forwarded to the target application."

* Option A (Site Authenticators) is incorrect because Site Authenticators configure how PingAccess communicates with applications requiring authentication, not how attributes are inserted into headers.

* Option B (Identity Mappings) is correct - this is the feature designed specifically to expose user attributes to applications via HTTP headers.

* Option C (Web Sessions) manages how sessions are stored and validated, but not the mapping of attributes into requests.

* Option D (HTTP Requests) refers to request/response processing rules, but attributes are not mapped here.

NEW QUESTION # 27

During a business review of an application, the administrator needs to change the Resource Authentication to anonymous. What are the two effects of making this change to the resource? (Choose 2 answers.)

- A. The resource requires no further authentication, and no rules will apply.
- **B. The resource requires no further authentication, and Identity Mappings still apply.**
- **C. The resource requires no further authentication, and Processing rules still apply.**
- D. The resource requires no further authentication, and all Access Control rules still apply.
- E. Requests to this resource are not logged, and Identity Mappings are applied.

Answer: B,C

Explanation:

When a resource is configured as anonymous, PingAccess does not challenge the user for authentication.

However, certain processing and identity propagation still occur.

Exact Extract:

"Anonymous resources do not require authentication. Identity mappings and request/response processing rules still apply."

* Option A is incorrect because rules such as identity mappings and processing still apply.

* Option B is correct - Identity Mappings can still forward attributes, even for anonymous access.

* Option C is correct - Processing rules (e.g., request/response modifications) still apply.

* Option D is incorrect - requests are logged; anonymous does not disable logging.

* Option E is incorrect - access control rules (authorization) are not evaluated for anonymous resources.

NEW QUESTION # 28

An internal audit reveals that an agent has been compromised. What action must be taken to re-secure the agent?

- A. Download and apply a newagent.propertiesfile
- B. Select a new Agent Trusted Certificate
- C. Change theagent.engine.configuration.shared.secretvalue in theagent.propertiesfile
- D. Reinstall the agent

Answer: A

Explanation:

When a PingAccess agent is compromised, the secure approach is to invalidate the existing credentials and issue a new configuration file from the PingAccess Admin Console. This provides a fresh agent.propertiesfile with new secrets, ensuring compromised keys cannot be reused.

Exact Extract:

"If an agent is compromised, revoke and regenerate the agent configuration by downloading a newagent.propertiesfile from the administrative console."

- * Option A is incorrect - manually changing the secret in the file does not propagate it to PingAccess.
- * Option B is incorrect - trusted certificates are not tied to agent authentication.
- * Option C is unnecessary - reinstalling the agent does not reset credentials.
- * Option D is correct - downloading a newagent.propertiesfile re-secures the agent.

NEW QUESTION # 29

An administrator is integrating a new PingAccess Proxied Application. The application will temporarily need a self-signed certificate during the POC/demo phase. PingAccess is terminating SSL and is responsible for loading the SSL certificate for the application. What initial action must the administrator take in PingAccess in this situation?

- A. Go to the Key Pairs section and create a new certificate
- B. Go to the Certificates section and create a new certificate
- C. Go to the Key Pairs section and import the PKCS#12 file provided by the customer's internal Certificate Authority
- D. Go to the Key Pairs section and import the PKCS#12 file provided by the publicly trusted Certificate Authority

Answer: A

Explanation:

For SSL termination, PingAccess requires a Key Pair (certificate + private key). During a POC/demo, when a self-signed certificate is used, the administrator can create it directly in the Key Pairs section of the console.

Exact Extract:

"Use the Key Pairs section to create self-signed certificates for testing or proof-of-concept deployments. For production, import a PKCS#12 file containing a certificate chain and private key."

- * Option A is incorrect - Certificates store trust anchors (CAs), not SSL termination certs.
- * Option B is incorrect - an internal CA-signed cert requires PKCS#12 import, not self-signed creation.
- * Option C is incorrect - a publicly trusted CA is not used for a demo phase.
- * Option D is correct - creating a new certificate in Key Pairs generates a self-signed cert suitable for demos.

NEW QUESTION # 30

An administrator needs to configure a signed JWT identity mapping for an application that expects to be able to validate the signature. Which endpoint does the application need to access to validate the signature?

- A. /pa-admin-api/v3/authTokenManagement
- B. /pa-admin-api/v3/identityMappinga/descriptor/jwtidentitymapping
- C. /pa/authtoken/JWKS
- D. /pa/aide/cb

Answer: C

Explanation:

Applications consuming signed JWTs need the JSON Web Key Set (JWKS) endpoint to retrieve the public keys used for validating JWT signatures. PingAccess exposes this at /pa/authtoken/JWKS.

Exact Extract:

"When using JWT identity mapping, applications can obtain the signing keys from the /pa/authtoken/JWKS endpoint to validate the JWT signature."

* Option A is correct - /pa/authtoken/JWKS provides the key set for signature validation.

* Option B is incorrect - that's an administrative API for configuring identity mappings, not a runtime validation endpoint.

* Option C is incorrect - /pa/aide/cb is the OIDC callback endpoint.

* Option D is incorrect - /pa-admin-api/v3/authTokenManagement is for admin token management, not JWT validation.
