100% Pass Quiz Docker - DCA - Docker Certified Associate (DCA) Exam Unparalleled Trustworthy Exam Torrent

It is inconceivable that Itexamguide Docker DCA test dumps have 100% hit rate. The dumps cover all questions you will encounter in the actual exam. So, you just master the questions and answers in the dumps and it is easy to pass DCA test. As one of the most important exam in Docker certification exam, the certificate of Docker DCA will give you benefits. And you must not miss the opportunity to pass DCA test successfully. If you fail in the exam, Itexamguide promises to give you FULL REFUND of your purchasing fees. In order to successfully pass the exam, hurry up to visit Itexamguide.com to know more details.

Docker Certified Associate (DCA) Exam Sample Questions (Q35-Q40):

NEW QUESTION # 35

One of several containers in a pod is marked as unhealthy after failing its livenessProbe many times. Is this the action taken by the orchestrator to fix the unhealthy container?

Solution: The unhealthy container is restarted.

- A. Yes
- B. No

Answer: A

Explanation:

A liveness probe is a mechanism for indicating your application's internal health to the Kubernetes control plane. Kubernetes uses liveness probes to detect issues within your pods. When a liveness check fails, Kubernetes restarts the container in an attempt to restore your service to an operational state¹. Therefore, the action taken by the orchestrator to fix the unhealthy container is to restart it. Reference:

NEW QUESTION # 36

Seven managers are in a swarm cluster.

Is this how should they be distributed across three datacenters or availability zones?

Solution: 3-2-2

- A. Yes
- B. No

Answer: A

Explanation:

Explanation

This is how they should be distributed across three datacenters or availability zones, because having an even distribution of managers across datacenters or availability zones ensures that the swarm can survive the loss of any one datacenter or availability zone and maintain quorum. According to the official documentation, managers should be distributed evenly across datacenters or availability zones to ensure that the swarm can survive the loss of any one datacenter or availability zone.

NEW QUESTION # 37

The Kubernetes yaml shown below describes a networkPolicy.

```
yaml
apiVersion: networking.k8s.io/v1
kind: NetworkPolicy
metadata:
  name: dca
  namespace: default
spec:
  podSelector:
    matchLabels:
      tier: backend
  ingress:
    - from:
      - podSelector:
          matchLabels:
            tier: api
    ...
```

Will the networkPolicy BLOCK this traffic?

Solution. a request issued from a pod bearing the tier: api label, to a pod bearing the tier: backend label

- A. Yes
- B. No

Answer: B

Explanation:

The provided Kubernetes NetworkPolicy YAML configuration indicates that the policy applies to pods with the label tier: backend in the default namespace. The ingress rule allows traffic from pods with the label tier: api. Therefore, a request issued from a pod bearing the tier: api label to a pod bearing the tier: backend label will not be blocked by this networkPolicy. This is because the networkPolicy explicitly allows ingress from pods with the tier: api label. For more information on Kubernetes Network

NEW QUESTION # 38

Will this command list all nodes in a swarm cluster from the command line?

Solution. 'docker inspect nodes

- A. Yes

- **B. No**

Answer: B

Explanation:

The command `docker inspect nodes` will not list all nodes in a swarm cluster from the command line. This is because `docker inspect` requires one or more names or IDs of the objects to inspect¹. To list all nodes in a swarm cluster, you need to use the command `docker node ls`, which will display information such as node ID, hostname, status, availability, and role³. References:

- * `docker inspect` | Docker Docs
- * `docker node ls` | Docker Docs
- * How to list nodes in a Docker swarm cluster

NEW QUESTION # 39

In the context of a swarm mode cluster, does this describe a node?

Solution. an instance of the Docker CLI connected to the swarm

- A. Yes
- **B. No**

Answer: B

Explanation:

The statement does not describe a node in the context of a swarm mode cluster. A node is a physical or virtual machine running Docker Engine 1.12 or later in swarm mode¹. An instance of the Docker CLI connected to the swarm is not a node, but a client that can interact with the swarm through the Docker API². The Docker CLI can be used to create a swarm, join nodes to a swarm, deploy services to a swarm, and manage swarm behavior³. References: How nodes work), Docker CLI), Swarm mode overview)

NEW QUESTION # 40

.....

We here guarantee that we will never sell the personal information of our candidates. There is no need for you to worry about the individual privacy under our rigorous privacy DCA protection system. As regards purchasing, our website and DCA study materials are absolutely safe and free of virus. For further consideration we will provide professional IT personnel to guide your installation and the use of our DCA Study Materials remotely. So you can buy our DCA study materials without any misgivings. If you have any questions, please you contact us online through the email.
