Scrum SAFe Practitioner Exam (6.0) Sample Questions (Q76-Q81):

NEW QUESTION # 76
Which of the following is not a type of Enabler story?

- A. Exploration
- B. Compliance
- C. Testing
- D. Infrastructure

Answer: C

NEW QUESTION # 77
Why is the modified Fibonacci sequence used when estimating?

- A. It can be used to predict unit test coverage
- B. It reflects the uncertainty in estimating larger items
- C. It results in greater precision
- D. It serves as a way to estimate large ranges

Answer: B

Explanation:
The modified Fibonacci sequence is a series of numbers that starts with 0, 1, 2, 3, 5, 8, 13, 20, 40, 100, and so on. It is used when estimating the relative size and complexity of backlog items, such as stories and features, using story points or normalized estimation. The modified Fibonacci sequence reflects the uncertainty in estimating larger items, as the gap between the numbers increases as the numbers get bigger. This means that the larger the item, the less precise the estimate, and the more likely it is to be split into smaller items. The modified Fibonacci sequence also helps to avoid the false sense of accuracy that comes from using linear scales, such as hours or days, which may not account for the variability and unpredictability of the work. NEW QUESTION # 80
Which statement is true about batch size?

- A. Large batch sizes ensure time for built-in quality
- B. Large batch sizes increase variability
- C. The handoff batch should be made as large as possible
- D. When Stories are broken into tasks, it means there are small batch sizes

Answer: B

Explanation:
Batch size is the size, measured in work product, of one completed unit of work. Cycle time is the amount of time it takes to complete one batch of work. What we focus on with lean development is reducing batch sizes, thereby reducing cycle times, thus increasing potential learning points over time1. The bigger a batch of work, the slower it flows through the system. We also have greater variability in the system because one big batch item may take 5 days to flow through the system whilst another big batch item may take 25 days to flow through the system. So that variability will impact the rate at which we can deliver value to customers2. Therefore, large batch sizes increase variability and reduce flow, which is contrary to the principles of lean development.
