SailPoint SailPoint-Certified-IdentityNow-Engineer試験概要、SailPoint-Certified-IdentityNow-Engineer日本語版参考書

みなさんにTopexamを選ぶのはより安心させるためにTopexamは部分のSailPoint SailPoint-Certified-IdentityNow-Engineer「SailPoint Certified IdentityNow Engineer」試験材料がネットで提供して、君が無料でダウンロードすることができます。安心に弊社の商品を選ぶとともに貴重な時間とエネルギーを節約することができます。Topexamは実際のSailPoint SailPoint-Certified-IdentityNow-Engineer認証試験の問題集が100%で君の試験の合格を保証します。君の明るい将来を祈っています。

SailPoint Certified IdentityNow Engineer 認定 SailPoint-Certified-IdentityNow-Engineer 試験問題 (Q16-Q21):

質問 # 16

Does this example accurately describe an IdentityNow data flow?

Solution:

1. Identity data is aggregated from an authoritative source.
2. The aggregated data is used to build an identity model.
3. Accounts are provisioned to source systems.
- 4 Identity attributes are periodically synchronized to write-enabled systems

- A. Yes
- B. No

正解: B

解説:

No, this example does not accurately describe the complete data flow in IdentityNow. While it correctly mentions identity aggregation and the building of an identity model, the third step,

"Accounts are provisioned to source systems," is not always part of the identity aggregation process.

Provisioning is typically a separate workflow initiated by access requests or certification decisions, not directly tied to identity aggregation. Additionally, the periodic synchronization of identity attributes happens as part of identity refreshes but is not necessarily tied to provisioning accounts in all cases.

[SailPoint IdentityNow Aggregation and Identity Model Documentation](#)

[SailPoint IdentityNow Provisioning Workflow Guide](#).

質問 # 17

Does this correctly describe Manager Correlation?

Solution: an approval process by which identities assigned as manager must periodically review and approve all access assigned to their employees.

- A. Yes
- B. No

正解: B

解説:

No, this statement describes Manager Certification rather than Manager Correlation. Manager Certification refers to an approval process in which managers are required to periodically review and approve the access rights of their direct reports. This is a governance feature used to ensure that employees only have the access they need, and it helps managers validate their team's access periodically. Manager Correlation, on the other hand, is about linking identities to their managers based on attributes.

Key Reference from SailPoint Documentation:

[Manager Certification vs. Manager Correlation](#): While Manager Certification involves periodic review and approval of access by managers, Manager Correlation is strictly about linking identities to their respective managers based on defined attributes.

質問 # 18

Is this statement true about using the IdentityNow APIs?

Solution: The APIs can be used by additional clients like cURL or Postman.

- A. Yes
- B. No

正解: A

解説:

Yes, SailPoint IdentityNow APIs can be accessed and utilized by external clients such as cURL or Postman. These tools are commonly used for testing and interacting with RESTful APIs, and they work seamlessly with IdentityNow's API framework. For example, developers can use Postman or cURL to make API calls for various actions like managing identities, querying data, and triggering provisioning events.

Key Reference from SailPoint Documentation:

[API Integration with Tools](#): SailPoint IdentityNow supports third-party tools like cURL and Postman for API interaction, as these

clients can handle HTTP requests, which is how IdentityNow's APIs communicate.

質問 #19

Is the following statement accurate regarding Separation of Duties (SoD)?

Solution: An SoD policy can define mitigating controls.

- A. Yes
- B. No

正解: A

解説:

Yes, an SoD policy can define mitigating controls. Mitigating controls are measures put in place to reduce the risk of having conflicting duties. For example, if it's not possible to completely segregate duties due to resource constraints or other business factors, mitigating controls such as enhanced auditing, periodic reviews, or dual approvals can be defined to manage the risk. SailPoint IdentityNow allows for the creation of SoD policies that include such mitigating controls to ensure compliance with security and governance requirements.

Key Reference from SailPoint Documentation:

Mitigating Controls in SoD Policies: SailPoint supports the definition of mitigating controls within SoD policies to manage and reduce risks when full separation of duties cannot be achieved.

質問 #20

Is this statement accurate regarding SailPoint's multi-tenant processing environment?

Solution: A proprietary fairness algorithm is used to manage and distribute the workload.

- A. Yes
- B. No

正解: A

解説:

Yes, SailPoint uses a proprietary fairness algorithm to manage and distribute workloads in its multi-tenant environment. This algorithm ensures that resources are allocated fairly among tenants, preventing any single tenant from consuming excessive resources at the expense of others. It helps maintain system performance and stability, balancing the processing load and providing equitable access to shared infrastructure in a multi-tenant setup.
