Dumpkiller offers accurate and reliable study materials to help you prepare for the Salesforce Integration-Architect Exam. They have prepared the best Salesforce Integration-Architect Exam Questions that provide authentic and reliable material. With Dumpkiller, many candidates have succeeded in passing the Salesforce Integration-Architect Exam.

The Salesforce Integration-Architect Exam is intended for individuals who have experience working with Salesforce, including knowledge of data modeling, security, and user interface design. Salesforce Certified Integration Architect certification exam covers a wide range of topics, including integration architecture, integration patterns, data integration, and API integration. Candidates are also tested on their knowledge of integration security and performance optimization.

Integration-Architect Actual Test - Integration-Architect Test Questions & Integration-Architect Exam Torrent

Compared with the paper version, we have the advantage of instant access to download, and you will receive your download link and password for Integration-Architect training materials within ten minutes, so that you can start learning as early as possible. In addition, we have free demo for you to have a try for Integration-Architect Exam barindumps, so that you can know what the complete version is like. Online and offline service are available, and if you have any questions for Integration-Architect exam materials, you can contact us, and we will give you reply as quickly as we can.

Salesforce Certified Integration Architect Sample Questions (Q23-Q28):

NEW QUESTION # 23

The director of customer service at Northern Trail Outfitters (NTO) wants to capture and trend specific business events that occur in

Salesforce in real time. The metrics will be accessed in an ad-hoc manner using an external analytics system. The events that are of interest are:

A customer has initiated a product exchange via a Case A customer service rep clicks on the "Authorize Exchange Product" menu item on the Case A customer has initiated a subscription cancellation via a Case A customer service rep clicks on the "Initiate Refund" menu item on the Case Which two solutions will meet these business requirements?

Choose 2 answers

- A. Case Workflow Rule that sends an Outbound Message.
- **B. Case after insert Trigger that publishes a Platform Event.**
- **C. Custom Apex controller that publishes a Platform Event.**
- D. Case after insert Trigger that executes a callout.

Answer: B,C

NEW QUESTION # 24

Northern Trail Outfitters' ERP is integrated with Salesforce and syncs several million contacts per day. To prevent specific data from syncing, the integration uses a SOQL query filtered by sharing hierarchy. Which two things should an architect do to improve the performance of the integration?

Choose 2 answers

- **A. Remove the sharing restrictions.**
- **B. Include selective criteria in query filters.**
- C. Include non-selective criteria in query filters.
- D. Remove the query filters.

Answer: A,B

Explanation:

Option C is correct because including selective criteria in query filters can improve the performance of the integration. Selective criteria are filters that reduce the number of records that need to be scanned by the query optimizer, such as indexed fields, standard indexes, or custom indexes. Selective criteria can help the query run faster and avoid hitting the query timeout limit or the query row limit.

Option D is correct because removing the sharing restrictions can improve the performance of the integration.

Sharing restrictions are filters that limit the access to records based on the user's role, profile, or sharing rules.

Sharing restrictions can add complexity and overhead to the query execution, as they require additional joins and calculations.

Removing the sharing restrictions can simplify the query and reduce the number of records that need to be processed.

Option A is incorrect because including non-selective criteria in query filters can degrade the performance of the integration. Non-selective criteria are filters that do not reduce the number of records that need to be scanned by the query optimizer, such as non-indexed fields, formula fields, or OR conditions. Non-selective criteria can cause the query to run slower and hit the query timeout limit or the query row limit.

Option B is incorrect because removing the query filters can degrade the performance of the integration.

Query filters are conditions that specify which records to retrieve from the database, such as WHERE clauses or LIMIT clauses.

Query filters can help the query run faster and avoid retrieving unnecessary or unwanted data. Removing the query filters can increase the number of records that need to be processed and transmitted by the integration.

NEW QUESTION # 25

An Architect has received a request to prevent employees that leave the company from accessing data in Salesforce after they are deactivated in the company's HR system.

What should an Architect determine before recommending a solution?

- A. Determine data volume requirements, then identify the loading schedule.
- B. Determine data access prevention requirements, then identify system constraints.
- **C. Determine data access prevention requirements, then identify frequency.**
- D. Determine inbound integration requirements, then identify frequency.

Answer: C

Explanation:

The Architect should determine the data access prevention requirements and then identify the system constraints before recommending a solution. The data access prevention requirements are the business rules and policies that define how to prevent deactivated employees from accessing Salesforce data. For example, the Architect should determine whether the HR system can send a notification to Salesforce when an employee is deactivated, or whether Salesforce needs to query the HR system periodically to check the employee status. The system constraints are the technical limitations and challenges that may affect the integration solution. For example, the Architect should determine whether the HR system supports outbound or inbound integration, what are the security and authentication protocols, what are the data formats and protocols, and what are the performance and scalability requirements. The frequency of the integration is not as important as the requirements and constraints, as it can be adjusted based on the business needs and technical feasibility. The data volume requirements and loading schedule are not relevant for this scenario, as they are more applicable for data migration or replication scenarios.

NEW QUESTION # 26

An enterprise architect has requested the Salesforce Integration architect to review the following (see diagram & description) and provide recommendations after carefully considering all constraints of the enterprise systems and Salesforce platform limits.

- * About 3,000 phone sales agents use a Salesforce Lightning UI concurrently to check eligibility of a customer for a qualifying offer.
 - * There are multiple eligibility systems that provides this service and are hosted externally. However, their current response times could take up to 90 seconds to process and return (there are discussions to reduce the response times in future, but no commitments are made).
 - * These eligibility systems can be accessed through APIs orchestrated via ESB (MuleSoft).
 - * All requests from Salesforce will have to traverse through customer's API Gateway layer and the API Gateway imposes a constraint of timing out requests after 9 seconds.
- Which three recommendations should be made?

Choose 3 answers

- A. Recommend synchronous Apex call-outs from Lightning UI to External Systems via Mule and implement polling on API gateway timeout.
- B. ESB (Mule) with cache/state management to return a requestID (or) response if available from external system.
- C. Use Continuation callouts to make the eligibility check request from Salesforce from Lightning UI at page load.
- D. When responses are received by Mule, create a Platform Event in Salesforce via Remote-Call-In and use the empAPI in the lightning UI to serve 3,000 concurrent users.
- E. Implement a 'Check Update' button that passes a requestID received from ESB (user action needed).

Answer: B,C,E

NEW QUESTION # 27

Universal Containers (UC) currently owns a middleware tool and they have developed an API-led integration architecture with three API tiers. The first tier interfaces directly with the systems of engagement, the second tier implements business logic and aggregates data, while the third tier interfaces directly with systems of record. Some of the systems of engagement will be a mobile application, a web application, and Salesforce.

UC has a business requirement to return data to the systems of engagement in different formats while also enforcing different security protocols.

What should an Integration Architect recommend to meet these requirements?

- Answer: D**
