Prep4pass's Data-Architect preparation material includes the most excellent features, prepared by the same dedicated experts who have come together to offer an integrated solution. Data-Architect Preparation material guarantee that you will get most excellent and simple method to pass your certification Data-Architect exams on the first attempt.

Salesforce Data-Architect Certification Exam is a proctored, multiple-choice exam that consists of 60 questions. Candidates have 105 minutes to complete the exam and must achieve a passing score of 63% or higher. Data-Architect Exam is administered online and can be taken from anywhere with a reliable internet connection.

## Salesforce Certified Data Architect Sample Questions (Q131-Q136):

### NEW QUESTION # 131

Northern Trail outfitters in migrating to salesforce from a legacy CRM system that identifies the agent relationships in a look-up table. What should the data architect do in order to migrate the data to Salesfoce?

- A. Migrate the data and assign to a non-person system user.

- B. Create custom objects to store agent relationships.
- C. Assign record owner based on relationship.
- D. Migrate to Salesforce without a record owner.

**Answer: B**

Explanation:

The correct answer is A. To migrate the data to Salesforce, the data architect should create custom objects to store agent relationships. This will allow the data architect to replicate the look-up table structure from the legacy CRM system and maintain the relationship data in Salesforce. Option B is incorrect because migrating to Salesforce without a record owner will cause errors and prevent the data from being imported. Option C is incorrect because assigning record owner based on relationship will not preserve the agent relationships from the legacy CRM system. Option D is incorrect because migrating the data and assigning to a non-person system user will not allow the users to access and modify the data.

### NEW QUESTION # 132

Cloud Kicks has the following requirements:

- Data needs to be sent from Salesforce to an external system to generate invoices from their Order Management System (OMS).
- A Salesforce administrator must be able to customize which fields will be sent to the external system without changing code.

What are two approaches for fulfilling these requirements? (Choose two.)

- A. An Outbound Message to determine which fields to send to the OMS.
- B. A set<objectFieldset> to determine which fields to send in an HTTP callout.
- C. A Field Set that determines which fields to send in an HTTP callout.
- D. Enable the field -level security permissions for the fields to send.

**Answer: A,C**

Explanation:

An Outbound Message is a native Salesforce feature that allows sending data to an external system without code. It can be configured to include any fields from the source object3. A Field Set is a collection of fields that can be used in Visualforce pages or Apex classes to dynamically determine the fields to send in an HTTP callout. Both of these approaches meet the requirements of Cloud Kicks.

### NEW QUESTION # 133

Universal Containers (UC) has implemented a master data management strategy, which uses a central system of truth, to ensure the entire company has the same customer information in all systems. UC customer data changes need to be accurate at all times in all of the systems. Salesforce is the identified system of record for this information.

What is the correct solution for ensuring all systems using customer data are kept up to date?

- A. Send customer record changes from Salesforce to each system in a nightly batch job.
- B. Have each system pull the record changes from Salesforce using change data capture.
- C. Send customer data nightly to the system of truth in a scheduled batch job.
- D. Send customer record changes from Salesforce to the system of truth in real time.

**Answer: D**

Explanation:

Having each system pull the record changes from Salesforce using change data capture (option D) is the correct solution for ensuring all systems using customer data are kept up to date, as it allows the systems to subscribe to real-time events from Salesforce and receive notifications when customer records are created, updated, deleted, or undeleted. Sending customer data nightly to the system of truth in a scheduled batch job (option A) or sending customer record changes from Salesforce to each system in a nightly batch job (option B) are not good solutions, as they may cause data latency and inconsistency, and they do not provide real-time updates. Sending customer record changes from Salesforce to the system of truth in real time (option C) is also not a good solution, as it does not address how the other systems will receive the updates from the system of truth.

### NEW QUESTION # 134

Universal Containers (UC) has a Salesforce instance with over 10.000 Account records. They have noticed similar, but not identical. Account names and addresses. What should UC do to ensure proper data quality?

- A. Make the Account Owner clean their Accounts' addresses, then merge Accounts with the same address.
- B. Use a service to standardize Account addresses, then use a 3rd -party tool to merge Accounts based on rules.
- **C. Enable Account de-duplication by creating matching rules in Salesforce, which will mass merge duplicate Accounts.**
- D. Run a report, find Accounts whose name starts with the same five characters, then merge those Accounts.

**Answer: C**

Explanation:

Enabling Account de-duplication by creating matching rules in Salesforce, which will mass merge duplicate Accounts, is what UC should do to ensure proper data quality for their Account records. Matching rules allow UC to define how Salesforce identifies duplicate Accounts based on various criteria, such as name, address, phone number, etc. Mass merge allows UC to merge up to 200 duplicate Accounts at a time, based on the matching rules. This simplifies and automates the process of de-duplicating Accounts and improves data quality. The other options are either more time-consuming, costly, or error-prone for ensuring proper data quality.

**NEW QUESTION # 135**

A health care provider wishes to use salesforce to track patient care. The following actions are in Salesforce

1. Payment Providers: Orgas who pay for the care 2 patients.
2. Doctors: They provide care plan for patients and need to support multiple patients, they are provided access to patient information.
3. Patients: They are individuals who need care.

A data architect needs to map the actor to Sf objects. What should be the optimal selection by the data architect?

- A. Patients as Contacts, Payment providers as Accounts, & Doctors as Accounts
- **B. Patients as Person Accounts, Payment providers as Accounts, & Doctors as Person Account**
- C. Patients as Person Accounts, Payment providers as Accounts, & Doctors as Contacts
- D. Patients as Accounts, Payment providers as Accounts, & Doctors as Person Accounts

**Answer: B**

Explanation:

Patients as Person Accounts, Payment providers as Accounts, & Doctors as Person Accounts is the optimal selection by the data architect to map the actor to Salesforce objects. This is because Person Accounts are a special type of accounts that can store both business and personal information for individual customers. Payment providers are organizations that pay for the care of patients, so they can be modeled as Accounts. Doctors are also individuals who provide care plans for patients and need access to patient information, so they can also be modeled as Person Accounts.
