Development-Lifecycle-and-Deployment-Architect Exam Dumps 100% Guarantee You Get Development-Lifecycle-and-Deployment-Architect Exam - PassLeaderVCE

Salesforce Development-Lifecycle-and-Deployment-Architect exam dumps is a surefire way to get success. PassLeaderVCE has assisted a lot of professionals in passing their Salesforce Development-Lifecycle-and-Deployment-Architect certification test. In case you don't pass the Salesforce Development-Lifecycle-and-Deployment-Architect pdf questions and practice tests, you have the full right to claim your full refund. You can download and test any Development-Lifecycle-and-Deployment-Architect Exam Questions format before purchase. So don't get worried, start Salesforce Development-Lifecycle-and-Deployment-Architect exam preparation and get successful.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q86-Q91):

NEW QUESTION # 86

Universal Containers has three types of releases in their release management strategy: daily, minor (monthly), and major (quarterly). A user has requested a new report to support an urgent client request. What release strategy would an Architect recommend?

- A. Utilize the major release process to create the report in a full sandbox and then deploy it to production.
- B. Utilize the major release process to create the report directly in production bypassing the full sandbox.
- C. Utilize the minor release process to create the report directly in production bypassing the full sandbox.
- **D. Utilize the daily release process to create the report directly in a full sandbox and then deploy it to production.**

Answer: D

Explanation:

The daily release process is the most suitable for creating a new report to support an urgent client request, as it can deliver the functionality in a timely manner. Creating the report in a full sandbox and then deploying it to production can ensure the quality and security of the report.

NEW QUESTION # 87

In the effort of improving the code quality, Universal Containers (UC) has asked a third-party system integrator to perform some independent code reviews. One piece of the feedback is the development team is seemingly not doing enough negative unit testing. Which are three usual symptoms of inadequate negative tests
Choose 3 answers

- A. The delivered user interfaces are regularly not meeting the expectations of the business users.
- **B. Developers constantly ask the testers for a screenshot of the error and the exact steps of reproducing the error.**
- C. Developers often have to turn to the debug log for details of the failed Apex executions.
- **D. When an Apex batch job runs at a scheduled time, an increased number of Apex execution errors occur over all.**
- **E. An Apex process runs into an un-handled exception when an HTTP callout has an unexpected status code in the response body.**

Answer: B,D,E

Explanation:

The usual symptoms of inadequate negative tests are the ones that indicate that the code is not handling the possible errors or exceptions that may occur in different scenarios. For example, when an Apex batch job runs at a scheduled time, an increased number of Apex execution errors occur over all¹, this means that the code is not handling the possible concurrency issues, governor limits, or data quality issues that may arise when the job runs. Similarly, when an Apex process runs into an un-handled exception when an HTTP callout has an unexpected status code in the response body¹, this means that the code is not handling the possible network issues, authentication issues, or API errors that may occur when making the callout. Another symptom is when developers constantly ask the testers for a screenshot of the error and the exact steps of reproducing the error¹, this means that the code is not logging the error details or providing meaningful error messages to the users. Option A is incorrect because turning to the debug log for details of the failed Apex executions is not a symptom of inadequate negative tests, but a normal practice of debugging the code. Option E is incorrect because the delivered user interfaces are not meeting the expectations of the business users is not a symptom of inadequate negative tests, but a symptom of poor user interface design or incomplete requirements.

NEW QUESTION # 88

Cloud Kicks (CK) is launching a new sneaker line during the upcoming holiday season and needs to do a thorough batch data testing before Go-Live. CK is using Salesforce unlimited edition.

What two sandbox types should the architect recommend for batch data testing?

Choose 2 answers

- **A. Partial Copy sandbox**
- B. Developer sandbox
- **C. Full sandbox**
- D. Developer Pro sandbox

Answer: A,C

NEW QUESTION # 89

Universal Containers (UC) is embarked on an enterprise Salesforce transformation journey. UC would like to streamline and automate deployment to different sandboxes during the build phase. Upon customer acceptance in UAT, the company requested to automate the production deployment as well.

As the deployment architect, what is the recommendation to satisfy the customer requirements?

- A. Recommend using an AppExchange solution that packages the deployment components and you can run the deployment wizard to track deployment result.
- **B. Recommend using the Continuous integration and the Continuous deployment tool and build the pipeline to deploy to sandboxes and production.**
- C. Recommend using SFDX and document the deployment commands with steps to be executed for each environment.
- D. Recommend using the ANT script and build a custom application to run the script and use change sets to deploy supported metadata.

Answer: B

Explanation:

Explanation

The recommendation to satisfy the customer requirements is to use a Continuous Integration and Continuous Deployment tool and build the pipeline to deploy to sandboxes and production. A Continuous Integration and Continuous Deployment tool can automate the process of building, testing, and deploying the changes to different environments, as well as provide feedback and visibility into the deployment status and results. This can help to streamline and accelerate the deployment process, as well as to ensure consistency and quality across the environments. Using SFDX and documenting the deployment commands with steps to be executed for each environment is not a good recommendation, as it still requires manual intervention and execution, which can be error-prone and time-consuming. Using ANT script and building a custom application to run the script and use change sets to deploy supported metadata is not a good recommendation, as it involves using multiple tools and methods, which can increase the complexity and risk of the deployment process. Using an AppExchange solution that packages the deployment components and you can run the deployment wizard to track deployment result is not a good recommendation, as it may not support all the metadata types and features that need to be deployed, and it may not integrate well with the SFDX tools and methodologies that UC is using.

NEW QUESTION # 90

What are three necessary components for establishing a governance framework? Choose 3 answers

- **A. Automated Testing**
- **B. Documentation Repository**
- C. Requirements Management
- D. Continuous Integration
- **E. Change Control Log**

Answer: A,B,E

NEW QUESTION # 91
