CCSK v5 Sample Questions

Check your knowledge before taking the exam

Domain 1: Cloud Computing Concepts & Architectures

Q1: Which of the following accurately defines the primary responsibility difference for IaaS, PaaS, and SaaS?

- In PaaS, the user manages the hardware and network infrastructure
- In SaaS, the user is responsible for managing and updating the application itself
- **In IaaS, the user manages applications, data, runtime, and OS**
- In IaaS, the provider manages both the infrastructure and applications

Justification: In the IaaS model, infrastructure management primarily lies with the user, except for the underlying hardware.

Q2: What does ISO/IEC 22123-1:2023 define cloud computing as?

- **A scalable and elastic pool of shareable resources**
- A static and local set of dedicated resources
- A fixed and isolated pool of private resources
- A static and flexible collection of isolated resources

Justification: This definition specifically highlights scalability, elasticity, and resource sharing, which are fundamental aspects of cloud computing as defined by ISO/IEC 22123-1:2023.

Q3: Which characteristic of cloud computing can potentially increase security risks when compared to traditional on-premises infrastructure?

- Elasticity
- Broad network access
- Resource pooling
- **Multi-tenancy**

Stop wasting time on meaningless things. There are a lot wonderful things waiting for you to do. You still have the opportunities to become successful and wealthy. The CCSK study materials is a kind of intelligent learning assistant, which is capable of aiding you pass the CCSK Exam easily. As long as you have the passion to become matter and take a challenge, you will find that our CCSK

practice engine can lead you to a brighter future.

The CCSK Exam is comprised of 60 multiple-choice questions, and candidates have 90 minutes to complete the exam. CCSK exam is delivered online and is available in multiple languages. CCSK exam is open-book, which means that candidates are allowed to reference the CSA's Security Guidance for Critical Areas of Focus in Cloud Computing V4.0 during the exam. However, the exam questions are designed to test a candidate's understanding of the material, not their ability to look up answers.

Cloud Security Alliance Certificate of Cloud Security Knowledge (v4.0) Exam Sample Questions (Q58-Q63):

NEW QUESTION # 58

Which term describes the practice in cloud compliance where a customer acquires a set of pre-approved regulatory or standards-based controls from a compliant provider?

- A. Automated compliance
- **B. Compliance inheritance**
- C. Attestation inheritance
- D. Audit inheritance

Answer: B

Explanation:

Compliance inheritance refers to the practice in cloud compliance where a customer leverages a set of pre-approved regulatory or standards-based controls that have been established and validated by a compliant cloud provider. Essentially, the cloud provider implements these controls, and the customer inherits the provider's compliance framework to meet their own regulatory requirements. This allows customers to benefit from the provider's compliance efforts without having to implement everything themselves.

Automated compliance refers to automating compliance tasks and processes but does not describe the practice of inheriting compliance controls. Attestation inheritance is not a standard term used in cloud compliance; attestation typically refers to formally certifying or declaring compliance. Audit inheritance would relate to the inheritance of audit reports or records, but it doesn't describe the broader process of inheriting compliance controls.

NEW QUESTION # 59

What should every cloud customer set up with its cloud service provider (CSP) that can be utilized in the event of an incident?

- A. A rainy day fund
- B. A back-up website
- **C. A communication plan**
- D. A data destruction plan
- E. A spill remediation kit

Answer: C

NEW QUESTION # 60

Stopping a function to control further risk to business is called:

- A. Mitigation
- B. Transference
- C. Acceptance
- **D. Avoidance**

Answer: D

Explanation:

Risk avoidance is the practice of coming up with alternatives so that the risk in question is not realised.

NEW QUESTION # 61

Which one of the following is the key tool of Cloud Governance?

- A. Business Impact Analysis(BIA)
- B. Auditor Selection
- C. Data classification
- **D. Contracts**

Answer: D

Explanation:

The primary tool of governance is the contract between a cloud provider and a cloud customer (this is true for public and private cloud). The contract is your only guarantee of any level of service or commitment Ref: CSA Security Guidance V4.0

NEW QUESTION # 62

Which of the following is a primary benefit of using Infrastructure as Code (IaC) in a security context?

- **A. Automated compliance checks**
- B. Manual patch management
- C. Ad hoc security policies
- D. Static resource allocation

Answer: A

Explanation:

The correct answer is D. Automated compliance checks.

Infrastructure as Code (IaC) is a key DevSecOps practice where infrastructure configurations are defined and managed through code. In a security context, the primary benefit of using IaC is the ability to automate compliance checks and enforce security best practices consistently across environments.

Key Benefits of IaC in Security:

Automated Compliance: IaC allows for the embedding of security policies directly into configuration scripts. This means that when infrastructure is deployed, it automatically adheres to compliance requirements (like NIST, CIS benchmarks).

Consistency and Repeatability: Since IaC scripts are version-controlled, any configuration changes are tracked, minimizing the risk of configuration drift.

Security by Design: By coding security configurations (like IAM roles, network ACLs, encryption settings), organizations ensure that every deployment meets security standards.

Reduced Human Error: Automating infrastructure provisioning reduces manual errors that can lead to vulnerabilities.

Why Other Options Are Incorrect:

A . Manual patch management: IaC promotes automated and repeatable configurations, reducing the need for manual patching.

B . Ad hoc security policies: IaC encourages standardized and consistent policies rather than ad hoc management.

C . Static resource allocation: IaC is dynamic and scalable, allowing for automatic scaling and configuration management rather than static resource setups.

Real-World Example:

Using tools like Terraform or AWS CloudFormation, organizations can define IAM policies, security group rules, and data encryption settings as part of the infrastructure code. These configurations are then automatically checked for compliance against established policies during deployment.

Security and Compliance in IaC:

Organizations can integrate tools like Terraform Compliance or AWS Config Rules to automatically verify that infrastructure settings align with regulatory requirements and internal security policies.
