WGU C838 MANAGING CLOUD SECURITY FINAL EXAM OA-with 100% verified solutions-2023-2024

You are the security subject matter expert (SME) for an organization considering a transition from the legacy environment into a hosted cloud provider's data center. One of the challenges you're facing is whether the cloud provider will be able to comply with the existing legislative and contractual frameworks your organization is required to follow. This is a _____ issue.

- a. Resiliency
- b. Privacy
- c. Performance
- d. Regulatory

D

76. You are the security subject matter expert (SME) for an organization considering a transition from the legacy environment into a hosted cloud provider's data center. One of the challenges you're facing is whether the cloud provider will be able to allow your organization to substantiate and determine with some assurance that all of the contract terms are being met. This is a(n) _____ issue.

- a. Regulatory
- b. Privacy
- c. Resiliency
- d. Auditability

D

77. Encryption is an essential tool for affording security to cloud-based operations. While it is possible to encrypt every system, piece of data, and transaction that takes place on the cloud, why might that not be the optimum choice for an organization?

- a. Key length variances don't provide any actual additional security.
- b. It would cause additional processing overhead and time delay.
- c. It might result in vendor lockout.
- d. The data subjects might be upset by this.

B

78. Encryption is an essential tool for affording security to cloud-based operations. While it is possible to encrypt every system, piece of data, and transaction that takes place on the cloud, why might that not be the optimum choice for an organization?

- a. It could increase the possibility of physical theft.
- b. Encryption won't work throughout the environment.
- c. The protection might be disproportionate to the value of the asset(s).
- d. Users will be able to see everything within the organization.

C

79. Which of the following is not an element of the identification component of identity and access management (IAM)?

- a. Provisioning
- b. Management
- c. Discretion
- d. Deprovisioning

C

80. Which of the following entities is most likely to play a vital role in the identity provisioning aspect of a user's experience in an organization?

WGU Managing Cloud Security (JY02) Sample Questions (Q40-Q45):

NEW QUESTION # 40

An organization consists of many divisions. Its leadership team has gathered the managers and key team members in each division to help create a disaster recovery plan. It studies the type of natural events that commonly occur and the risk involved for each location in which the organization has a data center. What is the leadership team doing in this scenario?

- A. Defining the disaster criteria
- B. Running a disaster declaration process
- C. Identifying the actions
- D. Performing an asset inventory

Answer: A

Explanation:

By analyzing natural events that could impact data centers and assessing the risks associated with each, the leadership team is defining the disaster criteria. This step determines what conditions or events qualify as disasters requiring activation of the recovery plan.

An asset inventory identifies systems, but here the focus is on external events. A disaster declaration process occurs during an actual event, and identifying actions comes later when response strategies are created.

Defining disaster criteria is essential to avoid ambiguity during crises. It establishes thresholds such as

"category 4 hurricanes," "regional power outages exceeding 12 hours," or "seismic events over a set magnitude." Clear criteria ensure consistent decision-making and timely activation of recovery procedures.

NEW QUESTION # 41

As part of training to help the data center engineers understand different attack vectors that affect the infrastructure, they work on a set of information about access and availability attacks that was presented. Part of the labs requires the engineers to identify different threat vectors and their names. Which threat prohibits the use of data by preventing access to it?

- A. Encryption
- B. Denial of service
- C. Brute force
- D. Rainbow tables

Answer: B

Explanation:

The described threat is a Denial of Service (DoS) attack. In security contexts, a DoS attack aims to make a system, application, or data unavailable to legitimate users by overwhelming resources. Unlike brute force or rainbow table attacks, which target authentication mechanisms, or encryption, which is a defensive control, DoS focuses on disrupting availability-the "A" in the Confidentiality, Integrity, Availability (CIA) triad.

DoS can be executed in many ways: flooding a network with traffic, exhausting server memory, or overwhelming application processes. When scaled by multiple coordinated systems, it becomes a Distributed Denial of Service (DDoS) attack. In either case, the effect is the same-authorized users cannot access critical data or services.

For cloud environments, where service uptime is crucial, DoS protections such as rate limiting, auto-scaling, and upstream filtering are essential. Training data center engineers to recognize DoS helps them understand the importance of resilience strategies and ensures continuity planning includes availability safeguards.

NEW QUESTION # 42

An engineer has been given the task of ensuring all of the keys used to encrypt archival data are securely stored according to industry standards. Which location is a secure option for the engineer to store encryption keys for decrypting data?

- A. A repository that is made private
- B. A repository that is made public

- C. An escrow that is kept local to the data it is tied to
- **D. An escrow that is kept separate from the data it is tied to**

Answer: D

Explanation:

Industry best practice requires that encryption keys are stored separately from the data they protect. This ensures that if the data storage system is compromised, attackers cannot immediately decrypt sensitive information. The use of a secure escrow system is a recognized approach.

An escrow provides controlled storage for encryption keys, ensuring they are only accessible by authorized processes and not co-located with the protected data. Keeping keys "local" to the data creates a single point of failure. A public or private repository without specialized protection mechanisms would also be insufficient due to risks of insider threats or misconfiguration.

By placing keys in an independent escrow system, the organization enforces separation of duties, strengthens defense-in-depth, and aligns with cryptographic standards from NIST and ISO. This practice is vital when dealing with archival data, where long-term confidentiality must be preserved even as systems evolve.

NEW QUESTION # 43

An organization is considering a cloud provider that has multivendor pathway connectivity. What does this feature provide?

- A. Contracts with fuel providers
- **B. Connections to several internet service providers**
- C. Contracts with heating, ventilation, and air conditioning (HVAC) providers
- D. Connections to several electric providers that are not on the same grid

Answer: B

Explanation:

Multivendor pathway connectivity refers to a cloud provider's ability to maintain connections with multiple internet service providers (ISPs). This ensures redundancy and reduces the risk of outages due to a single ISP failure.

Electric providers, fuel vendors, and HVAC contracts support facility resilience, but they are not directly tied to connectivity. The purpose of multivendor pathways is specifically to guarantee uninterrupted network access and resilience for customer workloads. By maintaining ISP redundancy, cloud providers improve availability and meet SLA commitments. This capability is especially critical for enterprises requiring high uptime or operating in regions where connectivity disruptions are common. It also provides flexibility in bandwidth management and routing optimization.

NEW QUESTION # 44

An organization wants to track how often a file is accessed and by which users. Which information rights management (IRM) solution should the organization implement?

- A. Dynamic policy control
- B. Persistent protection
- **C. Continuous auditing**
- D. Automatic expiration

Answer: C

Explanation:

Continuous auditing in the context of Information Rights Management (IRM) allows organizations to monitor access events in real time. It records who accessed a file, when, and how often. This enables organizations to enforce accountability and detect unusual access patterns, which are crucial for both security monitoring and compliance reporting.

Automatic expiration sets a time limit on file availability, while dynamic policy control adjusts permissions based on context (such as location or device). Persistent protection ensures files remain encrypted and controlled wherever they travel. While each feature is valuable, only continuous auditing provides the tracking and visibility into usage required by the scenario.

This approach aligns with governance requirements, providing an audit trail that supports incident response and compliance with data protection regulations. Continuous auditing strengthens both operational security and accountability.
