

SAP C-ABAPD-2309 Accurate Answers & Updated C-ABAPD-2309 Test Cram

P.S. Free 2025 SAP C-ABAPD-2309 dumps are available on Google Drive shared by ActualTorrent:
https://drive.google.com/open?id=1324vF6sjTO5_C34QHW9geLXYuQ1QLU5

It Contains a pool of real SAP C-ABAPD-2309 exam questions. This SAP Certified Associate - Back-End Developer - ABAP Cloud (C-ABAPD-2309) practice test is compatible with every windows-based system. One downloaded does not require an active internet connection to operate. You can self-evaluate your mistakes after each C-ABAPD-2309 Practice Exam attempt and work on the weak points that require more attention.

SAP C-ABAPD-2309 Exam Syllabus Topics:

Topic	Details
Topic 1	SAP clean core extensibility and ABAP cloud: The topic explains extension pattern, extension rules, ABAP cloud development, and ABAP cloud rules.
Topic 2	Core ABAP programming: This topic covers ABAP data types, the ABAP dictionary, modularization, exceptions SAP HANA database tables, and logical expressions, operator precedence.
Topic 3	ABAP core data services and data modeling: It focuses on Core Data Services (CDS) views, SAP HANA database tables, foreign key relationships, and annotations.
Topic 4	ABAP RESTful Application Programming Model: This topic explains the ABAP Restful Application Programming model, ABAP development, and the architecture of the ABAP Restful Application Programming model.
Topic 5	ABAP SQL and code pushdown: It discusses ABAP SQL, arithmetic expressions, manage dates, and create joins.

Updated SAP C-ABAPD-2309 Test Cram | Latest C-ABAPD-2309 Dumps Sheet

One failure makes many candidates fall into despair, become unconfident or even someone want to give up testing for IT certification. Now C-ABAPD-2309 reliable practice exam online will help you out. It covers most real test questions and will assist

you to clear exam certainly. You will be confident in your test. C-ABAPD-2309 reliable practice exam online will be an important choice for your SAP certification. Sometimes choice is greater than effort.

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q52-Q57):

NEW QUESTION # 52

Refer to the Exhibit.

You have the following CDS definition:

```
define view entity Z_ENTITY as select from Z_SOURCE1 as _Source1
association to Z_SOURCE2 as _Source2
???

{
  key carrier_id as Carrier,
  key connection_id as Connection,
  cityfrom as DepartureCity,
  cityto as ArrivalCity ,
  _Source2
}
```

(The data sources are joined by the field carrier_id. The name of the corresponding field in Z_SOURCE2 is carrier_id.)

Which of the following ON conditions must you insert in place of "???"?

- A. ON Sprojection Camer=Source2 carrier_id
- B. ON Z_Source1.camer_id = 7_Source2 carrier_id
- **C. ON Sprojection.carrier_id=Z_Source2.carrier_id**
- D. ON Sprojection. Carrier Source2.carrier

Answer: C

Explanation:

The correct ON condition that must be inserted in place of "???" is:

ON Sprojection.carrier_id=Z_Source2.carrier_id

This ON condition specifies the join condition between the CDS view Sprojection and the database table Z_Source2. The join condition is based on the field carrier_id, which is the primary key of both the CDS view and the database table. The ON condition ensures that only the records that have the same value for the carrier_id field are joined together.

The other options are not valid ON conditions, because:

A) ON Z_Source1.camer_id = 7_Source2 carrier_id is not valid because Z_Source1 and 7_Source2 are not valid data sources in the given code. There is no CDS view or database table named Z_Source1 or 7_Source2. The correct names are Z_Source1 and Z_Source2. Moreover, the field camer_id is not a valid field in the given code. There is no field named camer_id in any of the data sources. The correct name is carrier_id.

B) ON Sprojection Camer=Source2 carrier_id is not valid because Sprojection and Source2 are not valid data sources in the given code. There is no CDS view or database table named Sprojection or Source2. The correct names are Sprojection and Z_Source2. Moreover, the field Camer is not a valid field in the given code. There is no field named Camer in any of the data sources. The correct name is carrier_id. Furthermore, the ON condition is missing the dot (.) operator between the data source name and the field name, which is required to access the fields of the data source.

C) ON Sprojection. Carrier Source2.carrier is not valid because Carrier and carrier are not valid fields in the given code. There is no field named Carrier or carrier in any of the data sources. The correct name is carrier_id. Moreover, the ON condition is missing the dot (.) operator between the data source name and the field name, which is required to access the fields of the data source.

NEW QUESTION # 53

/DMO/I_Connection is a CDS view.

What variable type is connection full based on the following code? DATA connection full TYPE

/DMD/I_Connection.

- A. Simple variable
- B. Internal Table
- **C. Structure**

Answer: C

Explanation:

Based on the following code, the variable type of connection_full is a structure. A structure is a complex data type that consists of a group of related data objects, called components, that have their own data types and names. A structure can be defined using the TYPES statement or based on an existing structure type, such as a CDS view entity or a CDS DDIC-based view. In this case, the variable connection_full is declared using the TYPE addition, which means that it has the same structure type as the CDS view entity /DMO/I_Connection.

The CDS view entity /DMO/I_Connection is a data model view that defines a data model based on the database table

/DMO/Connection. The CDS view entity /DMO/I_Connection has the following components:

carrid, connid, airpfrom, airpto, distance, and fltime. Therefore, the variable connection_full has the same components as the CDS view entity /DMO/I_Connection, and each component has the same data type and length as the corresponding field in the database table /DMO/Connection.

NEW QUESTION # 54

In class ZCL_CLASS_A, you use the statement DATA var TYPE ***

What may stand in place of ***? Note: There are 2 correct answers to this question.

- A. The name of a type defined privately in another class
- **B. The name of a data element from the ABAP Dictionary**
- **C. The name of a domain from the ABAP Dictionary**
- D. The name of a type defined privately in class ZCL_CLASS_A

Answer: B,C

Explanation:

In class ZCL_CLASS_A, you use the statement DATA var TYPE *** to declare a data object named var with a data type specified by ***. The data type can be any of the following1:

* A predefined ABAP type, such as i, f, c, string, xstring, and so on.

* A data element from the ABAP Dictionary, such as matnr, carrid, buksr, and so on. A data element defines the semantic and technical attributes of a data field, such as the domain, the length, the data type, the description, and the value range2.

* A domain from the ABAP Dictionary, such as matnr_d, carrid_d, buksr_d, and so on. A domain defines the technical attributes of a data field, such as the data type, the length, the output length, the number of decimal places, and the value range3.

* A type defined globally in a class, an interface, or a type pool, such as zcl_class_b=>type_a, zif_interface_c=>type_b, ztype_pool_d=>type_c, and so on. A global type is a type that is defined in a global repository object and can be used in any program or class4.

* A type defined locally in the current class, such as type_a, type_b, type_c, and so on. A local type is a type that is defined in the declaration part of a class and can only be used within the class5.

Therefore, the possible values for *** are B. the name of a data element from the ABAP Dictionary and D. the name of a domain from the ABAP Dictionary. The other options are not valid because:

* A. The name of a type defined privately in class ZCL_CLASS_A is a local type and cannot be used with the DATA statement. A local type can only be used with the TYPES statement5.

* C. The name of a type defined privately in another class is a private type and cannot be accessed from outside the class. A private type can only be used within the class that defines it.

NEW QUESTION # 55

For the assignment, gv_target = gv_source.

which of the following data declarations will always work without truncation or rounding? Note: There are 2 correct answers to this question.

- **A. DATA gv_source TYPE c. to DATA gv_target TYPE string**
- B. DATA gv_source TYPE p LENGTH 8 DECIMALS 3. to DATA gv_target TYPE p LENGTH 16 DECIMALS 2.
- **C. DATA gv_source TYPE d. to DATA gv_target TYPE string**
- D. DATA gv_source TYPE string, to DATA gv_target TYPE c.

Answer: A,C

Explanation:

Explanation

The data declarations that will always work without truncation or rounding for the assignment `gv_target = gv_source` are B and C. This is because the target data type string is a variable-length character type that can hold any character string, including those of data types c (fixed-length character) and d (date). The assignment of a character or date value to a string variable will not cause any loss of information or precision, as the string variable will adjust its length to match the source value¹².

You cannot do any of the following:

A). DATA `gv_source` TYPE string, to DATA `gv_target` TYPE c.: This data declaration may cause truncation for the assignment `gv_target = gv_source`. This is because the target data type c is a fixed-length character type that has a predefined length. If the source value of type string is longer than the target length of type c, the source value will be truncated on the right to fit the target length¹².

D). DATA `gv_source` TYPE p LENGTH 8 DECIMALS 3. to DATA `gv_target` TYPE p LENGTH 16 DECIMALS 2.: This data declaration may cause rounding for the assignment `gv_target = gv_source`.

This is because the target data type p is a packed decimal type that has a predefined length and number of decimal places. If the source value of type p has more decimal places than the target type p, the source value will be rounded to the target number of decimal places¹².

NEW QUESTION # 56

The class `zcl_demo_class` is in a software component with the language version set to "Standard ABAP". The function module "ZF1" is in a software component with the language version set to "ABAP Cloud". Both the class and function module are customer created. Regarding line #6, which of the following is a valid statement?

- A. 'ZF1' can be called whether it has been released or not for cloud development.
- **B. 'ZF1' can be called via a wrapper that itself has been released for cloud development.**
- C. 'ZF1' must be released for cloud development to be called.
- D. 'ZF1' can be called via a wrapper that itself has not been released for cloud development.

Answer: B

Explanation:

Explanation

The function module ZF1 is in a software component with the language version set to "ABAP Cloud". This means that it follows the ABAP Cloud Development Model, which requires the usage of public SAP APIs and extension points to access SAP functionality and data. These APIs and extension points are released by SAP and documented in the SAP API Business Hub¹. Customer-created function modules are not part of the public SAP APIs and are not released for cloud development. Therefore, calling a function module directly from a class with the language version set to "Standard ABAP" is not allowed and will result in a syntax error.

However, there is a possible way to call a function module indirectly from a class with the language version set to "Standard ABAP": Create a wrapper class or interface for the function module and release it for cloud development. A wrapper is a class or interface that encapsulates the function module and exposes its functionality through public methods or attributes. The wrapper must be created in a software component with the language version set to "ABAP Cloud" and must be marked as released for cloud development using the annotation `@EndUserText.label`. The wrapper can then be called from a class with the language version set to "Standard ABAP" using the public methods or attributes².

For example, the following code snippet shows how to create a wrapper class for the function module ZF1 and call it from the class `zcl_demo_class`:

```
@EndUserText.label: 'Wrapper for ZF1' CLASS zcl_wrapper_zf1 DEFINITION PUBLIC FINAL CREATE PUBLIC. PUBLIC SECTION. CLASS-METHODS: call_zf1 IMPORTING iv_a TYPE i iv_b TYPE i EXPORTING ev_result TYPE i
```

ENDCLASS.

```
CLASS zcl_wrapper_zfl IMPLEMENTATION. METHOD call_zfl. CALL FUNCTION 'ZF1' EXPORTING a = iv_a b = iv_b  
IMPORTING result = ev_result. ENDMETHOD. ENDCLASS.
```

```
CLASS zcl_demo_class DEFINITION. METHODS: ml. ENDCLASS.
```

```
CLASS zcl_demo_class IMPLEMENTATION. METHOD ml. DATA(lv_result) =
```

```
zcl_wrapper_zfl=>call_zfl( iv_a = 2 iv_b = 3 ). WRITE: / lv_result. ENDMETHOD. ENDCLASS.
```

The output of this code is:

5

NEW QUESTION # 57

.....

Take advantage of the ActualTorrent's SAP training materials to prepare for the exam, let me feel that the exam have never so easy to pass. This is someone who passed the examination said to us. With ActualTorrent SAP C-ABAPD-2309 Exam Certification training, you can sort out your messy thoughts, and no longer twitchy for the exam. ActualTorrent have some questions and answers provided free of charge as a trial. If I just said, you may be not believe that. But as long as you use the trial version, you will believe what I say. You will know the effect of this exam materials.
