PracticeTorrent's Amazon SAP-C02 exam training materials are the best training materials of all the Internet training resources. Our visibility is very high, which are results that obtained through many candidates who have used the PracticeTorrent's Amazon SAP-C02 exam training materials. If you also use PracticeTorrent's Amazon SAP-C02 Exam Training materials, we can give you 100% guarantee of success. If you do not pass the exam, we will refund the full purchase cost to you. For the vital interests of the majority of candidates, PracticeTorrent is absolutely trustworthy.

## Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q312-Q317):

### NEW QUESTION # 312

A company is using AWS CloudFormation to deploy its infrastructure. The company is concerned that if a production CloudFormation stack is deleted, important data stored in Amazon RDS databases or Amazon EBS volumes might also be deleted. How can the company prevent users from accidentally deleting data in this way?

- A. Modify IAM policies to deny deleting RDS and EBS resources that are tagged with an "aws:cloudformation:stack-name" tag.
- **B. Modify the CloudFormation templates to add a DeletionPolicy attribute to RDS and EBS resources.**
- C. Configure a stack policy that disallows the deletion of RDS and EBS resources.
- D. Use AWS Config rules to prevent deleting RDS and EBS resources.

**Answer: B**

Explanation:

Explanation

Modifying the CloudFormation templates to add a DeletionPolicy attribute to RDS and EBS resources, is another valid solution to prevent accidental deletion of data in this scenario. By adding a DeletionPolicy attribute of "Retain" to RDS and EBS resources in the CloudFormation templates, the company can ensure that these resources and their data are not deleted when the CloudFormation stack is deleted. This is a way to prevent accidental deletion of data by preserving the resources when the stack is deleted.

### NEW QUESTION # 313

A company's CISO has asked a Solutions Architect to re-engineer the company's current CI/CD practices to make sure patch deployments to its applications can happen as quickly as possible with minimal downtime if vulnerabilities are discovered. The company must also be able to quickly roll back a change in case of errors.

The web application is deployed in a fleet of Amazon EC2 instances behind an Application Load Balancer. The company is currently using GitHub to host the application source code, and has configured an AWS CodeBuild project to build the application. The company also intends to use AWS CodePipeline to trigger builds from GitHub commits using the existing CodeBuild project. What CI/CD configuration meets all of the requirements?

- **A. Configure CodePipeline with a deploy stage using AWS CodeDeploy configured for blue/green deployments. Monitor the newly deployed code, and, if there are any issues, trigger a manual rollback using CodeDeploy.**
- B. Configure CodePipeline with a deploy stage using AWS CloudFormation to create a pipeline for test and production stacks. Monitor the newly deployed code, and, if there are any issues, push another code update.
- C. Configure CodePipeline with a deploy stage using AWS CodeDeploy configured for in-place deployment. Monitor the newly deployed code, and, if there are any issues, push another code update.
- D. Configure the CodePipeline with a deploy stage using AWS OpsWorks and in-place deployments. Monitor the newly deployed code, and, if there are any issues, push another code update.

**Answer: A**

### NEW QUESTION # 314

A company has an on-premises Microsoft SQL Server database that writes a nightly 200 GB export to a local drive. The company wants to move the backups to more robust cloud storage on Amazon S3. The company has set up a 10 Gbps AWS Direct Connect connection between the on-premises data center and AWS. Which solution meets these requirements Most cost effectively?

- A. Create an Amazon FSx for Windows File Server Multi-AZ system within the VPC that is connected to the Direct Connect connection. Create a new SMB file share. Write nightly database exports to an SMB file share on the Amazon FSx file system. Enable nightly backups.

- B. Create a new S3 buckets. Deploy an AWS Storage Gateway volume gateway within the VPC that is connected to the Direct Connect connection. Create a new SMB file share. Write nightly database exports to the new SMB file share on the volume gateway, and automate copies of this data to an S3 bucket.
- C. Create a new S3 bucket Deploy an AWS Storage Gateway file gateway within the VPC that is connected to the Direct Connect connection. Create a new SMB file share. Write nightly database exports to the new SMB file share.
- D. Create an Amzon FSx for Windows File Server Single-AZ file system within the VPC that is connected to the Direct Connect connection. Create a new SMB file share. Write nightly database exports to an SMB file share on the Amazon FSx file system Enable backups.

**Answer: C**

Explanation:

<https://aws.amazon.com/storagegateway/file/?nc=sn&loc=2&dn=2>

### NEW QUESTION # 315

A retail company needs to provide a series of data files to another company, which is its business partner These files are saved in an Amazon S3 bucket under Account A. which belongs to the retail company. The business partner company wants one of its IAM users. User\_DataProcessor. to access the files from its own AWS account (Account B).

Which combination of steps must the companies take so that User\_DataProcessor can access the S3 bucket successfully? (Select TWO.)

- A. In Account A. set the S3 bucket policy to the following:

```
{
  "Effect": "Allow",
  "Action": [
    "s3:GetObject",
    "s3:ListBucket"
  ],
  "Resource": "arn:aws:s3:::AccountABucketName/*"
}
```

- B. In Account A. set the S3 bucket policy to the following:

```
{
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::AccountB:user/User_DataProcessor"
  },
  "Action": [
    "s3:GetObject",
    "s3:ListBucket"
  ],
  "Resource": [
    "arn:aws:s3:::AccountABucketName/*"
  ]
}
```

- C. In Account B. set the permissions of User\_DataProcessor to the following:

```

{
  "Effect": "Allow",
  "Action": [
    "s3:GetObject",
    "s3:ListBucket"
  ],
  "Resource": "arn:aws:s3:::AccountABucketName/*"
}

```

- D. Turn on the cross-origin resource sharing (CORS) feature for the S3 bucket in Account
- E. In Account Bt set the permissions of User\_DataProcessor to the following:

```

{
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::AccountB:user/User_DataProcessor"
  },
  "Action": [
    "s3:GetObject",
    "s3:ListBucket"
  ],
  "Resource": [
    "arn:aws:s3:::AccountABucketName/*"
  ]
}

```

**Answer: B,C**

Explanation:

<https://aws.amazon.com/premiumsupport/knowledge-center/cross-account-access-s3/>

### NEW QUESTION # 316

A solutions architect must provide a secure way for a team of cloud engineers to use the AWS CLI to upload objects into an Amazon S3 bucket. Each cloud engineer has an IAM user. IAM access keys and a virtual multi-factor authentication (MFA) device. The IAM users for the cloud engineers are in a group that is named S3-access. The cloud engineers must use MFA to perform any actions in Amazon S3. Which solution will meet these requirements?

- A. Attach a policy to the S3-access group to deny all S3 actions unless MFA is present. Request temporary credentials from AWS Security Token Service (AWS STS). Attach the temporary credentials in a profile that Amazon S3 will reference when the user performs actions in Amazon S3.
- B. Attach a policy to the S3-access group to deny all S3 actions unless MFA is present. Use IAM access keys with the AWS CLI to call Amazon S3.
- C. Attach a policy to the S3 bucket to prompt the IAM user for an MFA code when the IAM user performs actions on the S3 bucket. Use IAM access keys with the AWS CLI to call Amazon S3.
- D. Update the trust policy for the S3-access group to require principals to use MFA when principals assume the group. Use IAM access keys with the AWS CLI to call Amazon S3.

**Answer: A**

Explanation:

Explanation:

The company should attach a policy to the S3-access group to deny all S3 actions unless MFA is present. The company should request temporary credentials from AWS Security Token Service (AWS STS). The company should attach the temporary credentials in a profile that Amazon S3 will reference when the user performs actions in Amazon S3. This solution will meet the requirements because AWS STS is a service that enables you to request temporary, limited-privilege credentials for IAM users or for users that you authenticate (federated users). You can use MFA with AWS STS to provide an extra layer of security when

requesting temporary credentials<sup>1</sup>. You can use the `sts get-session-token` AWS CLI command to request temporary credentials that include an MFA token<sup>2</sup>. You can then use these credentials with the AWS CLI to access Amazon S3 resources. To do this, you need to attach a policy to the IAM group that denies all S3 actions unless MFA is present<sup>3</sup>. You also need to create a profile in the AWS CLI configuration file that references the temporary credentials.

The other options are not correct because:

- \* Attaching a policy to the S3 bucket to prompt the IAM user for an MFA code when the IAM user performs actions on the S3 bucket would not work because policies attached to S3 buckets cannot enforce MFA authentication. Policies attached to S3 buckets are resource-based policies that define what actions can be performed on the bucket and by whom. They do not have any logic to prompt for an MFA code or verify it.

- \* Updating the trust policy for the S3-access group to require principals to use MFA when principals assume the group would not work because trust policies are used for roles, not groups. Trust policies are policies that define which principals can assume a role. They do not apply to groups, which are collections of IAM users that share permissions.

- \* Creating an Amazon Route 53 Resolver DNS Firewall domain list that contains the allowed domains and configuring a DNS Firewall rule group with rules to allow or block requests based on the domain list would not help with enforcing MFA authentication for Amazon S3 actions. Amazon Route 53 Resolver DNS Firewall is a feature that enables you to filter and regulate outbound DNS traffic for your VPC. You can create reusable collections of filtering rules in DNS Firewall rule groups and associate them with your VPCs. You can specify lists of domain names to allow or block, and you can customize the responses for the DNS queries that you block. This feature is useful for controlling access to sites and blocking DNS-level threats, but not for requiring MFA authentication.
