SAP Certified Associate - Integration Developer Sample Questions (Q61-Q66):

NEW QUESTION # 61
What is Representational State Transfer (REST)?

- A. An application protocol

- B. A description language for APIs
- C. A message protocol
- D. An architectural style

Answer: D

Explanation:
Representational State Transfer (REST) is an architectural style for designing web services that are based on the stateless exchange of resources. REST uses uniform and predefined methods, such as GET, POST, PUT, and DELETE, to manipulate resources identified by URIs. REST also supports different formats for data representation, such as XML, JSON, or plain text. NEW QUESTION # 62
You are creating an API proxy. Which of the following is a valid path prefix?

- A. /sap/opu/odata
- B. /sap/odu/odata
- C. /soap/opu/odata
- D. /sap/opo/odata

Answer: A

Explanation:
In SAP systems (e.g., S/4HANA, SAP Gateway), OData services follow a standard URL path:
/sap/opu/odata # The valid and official prefix for OData services.
Example: /sap/opu/odata/sap/API_BUSINESS_PARTNER
Other options:
/sap/opo/odata and /sap/odu/odata # Typographical variations, not valid.
/soap/opu/odata # Incorrect, since OData is not SOAP-based.
Thus, the valid prefix is /sap/opu/odata.

NEW QUESTION # 63
You want to implement a synchronous call to a remote HTTP API as an integration flow component. Which adapter can you use?

- A. AMQP
- B. SFTP
- C. OData
- D. Mail

Answer: C

Explanation:
For a synchronous call to a remote HTTP API in an integration flow:
The OData adapter (or HTTP adapter) is used to perform synchronous request-reply communication with REST-based services.
AMQP # Messaging protocol, not synchronous.
SFTP # File-based transfer, asynchronous.
Mail # For SMTP/IMAP, not synchronous API calls.
Thus, the correct adapter for a synchronous remote API call is OData (or HTTP adapter, depending on configuration).

NEW QUESTION # 64
Which data store operation can you use to save a customer ID?

- A. GET
- B. WRITE
- C. SELECT
- D. POST

Answer: B

Explanation:

In SAP Cloud Integration (part of Integration Suite), the Data Store operations allow temporary or persistent storage of messages for asynchronous processing or correlation.

WRITE # Used to save/store data (e.g., Customer ID) in the Data Store.

GET # Retrieves stored data.

SELECT # Reads stored data with filters.

POST # Not a valid Data Store operation in SAP CPI (it's an HTTP verb).

Hence, to save a customer ID, the correct operation is WRITE.

NEW QUESTION # 65

You have set up a basic authentication policy, but the API proxy returns an HTTP status of 401.What could be a reason?

- A. In the AssignMessage policy, the Assign To tag has the type="postFlow"
- B. In the AssignMessage policy, the Assign To tag has the type="response"
- C. In the AssignMessage policy, the Assign To tag has the type="preFlow"
- D. In the AssignMessage policy, the Assign To tag has the type="request"

Answer: D

Explanation:

In API Management (SAP Integration Suite), when implementing Basic Authentication policies:

If the AssignMessage policy does not correctly assign credentials to the request message, authentication will fail.

This results in HTTP 401 Unauthorized.

Other tags like preFlow, postFlow, response are policy flow phases, but the credentials must be applied to the request for proper authentication.

Thus, the root cause is when the Assign To = request is missing/misconfigured.
