

SAP certification C-ABAPD-2309 exam free exercises updates

P.S. Free & New C-ABAPD-2309 dumps are available on Google Drive shared by ExamDiscuss: https://drive.google.com/open?id=13iWoLkty5cZc7_QRwffkpxhC4VucC0PF

Team of ExamDiscuss is dedicated to giving SAP C-ABAPD-2309 exam takers the updated C-ABAPD-2309 practice exam material to enable them to clear the exam in one go. Our customers may be sure they are getting the SAP C-ABAPD-2309 Real Exam Questions PDF from ExamDiscuss for speedy preparation. You can also carry the C-ABAPD-2309 PDF exam questions in hard copy as they are printable as well.

In the past few years, C-ABAPD-2309 study materials have helped countless candidates pass the C-ABAPD-2309 exam. After having a C-ABAPD-2309 certification, some of them encountered better opportunities for development, some went to great companies, and some became professionals in the field. C-ABAPD-2309 study materials have stood the test of time and market and received countless praises. Through the good reputation of word of mouth, more and more people choose to use C-ABAPD-2309 Study Materials to prepare for the C-ABAPD-2309 exam, which makes us very gratified. Please be assured that we will stand firmly by every warrior who will pass the exam. C-ABAPD-2309 study materials have the following characteristics:

>> Valid C-ABAPD-2309 Exam Papers <<

100% Pass 2025 C-ABAPD-2309: High-quality Valid SAP Certified Associate - Back-End Developer - ABAP Cloud Exam Papers

Do some fresh things each day that moves you out of your comfort zone. If you stay cozy every day, you will gradually become lazy. Now, you have the opportunity to change your current conditions. Our C-ABAPD-2309 real exam dumps are specially prepared for you. Try our C-ABAPD-2309 study tool and absorb new knowledge. After a period of learning, you will find that you are making progress. The knowledge you have studied on our C-ABAPD-2309 Exam Question will enrich your life and make you wise. Our C-ABAPD-2309 real exam dumps are manufactured carefully, which could endure the test of practice. Stable and healthy development is our long lasting pursuit. In order to avoid fake products, we strongly advise you to purchase our C-ABAPD-2309 exam question on our official website.

SAP C-ABAPD-2309 Exam Syllabus Topics:

Topic	Details
Topic 1	ABAP core data services and data modeling: It focuses on Core Data Services (CDS) views, SAP HANA database tables, foreign key relationships, and annotations.
Topic 2	Object-oriented design: It measures your knowledge about encapsulation, upcast, inheritance, polymorphism, and interfaces. Moreover, the topic evaluates your knowledge about constructor calls, Exception classes, and singleton pattern.

- Core ABAP programming: This topic covers ABAP data types, the ABAP dictionary, modularization, exceptions SAP HANA database tables, and logical expressions, operator precedence.

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q35-Q40):

NEW QUESTION # 35

Which of the following are incomplete ABAP types? Note: There are 2 correct answers to this question.

- A. String
- B. C
- C. T
- D. P

Answer: B,D

Explanation:

Incomplete ABAP types are types that do not specify all the attributes of a data type, such as the length, the number of decimal places, or the value range. Incomplete types can only be used for the typing of field symbols and formal parameters, not for the definition of data objects or constants. Incomplete types can be either predefined or user-defined¹.

The following are incomplete ABAP types:

* C. C is a type for character strings with a generic length. The length of the character string has to be specified when a data object or a constant is defined with this type. For example, DATA text TYPE c LENGTH 10 defines a data object named text with a type c and a length of 10 characters².

* D. P is a type for packed numbers with a generic length and a generic number of decimal places. The length and the number of decimal places of the packed number have to be specified when a data object or a constant is defined with this type. For example, DATA amount TYPE p LENGTH 8 DECIMALS 2 defines a data object named amount with a type p, a length of 8 bytes, and 2 decimal places³.

The following are not incomplete ABAP types, because they specify all the attributes of a data type:

* A. String is a type for variable-length character strings. The length of the character string is determined at runtime and can vary from 0 to 2,147,483,647 characters. The length does not have to be specified when a data object or a constant is defined with this type. For example, DATA text TYPE string defines a data object named text with a type string and a variable length⁴.

* B. T is a type for time values in the format HHMMSS. The length of the time value is fixed at 6 characters and does not have to be specified when a data object or a constant is defined with this type.

* For example, DATA time TYPE t defines a data object named time with a type t and a length of 6 characters.

NEW QUESTION # 36

You have a superclass super1 and a subclass subl of super1. Each class has an instance constructor and a static constructor. The first statement of your program creates an instance of subl. In which sequence will the constructors be executed?

Answer:

Explanation:

Explanation:

The sequence in which the constructors will be executed is as follows:

* Class constructor of superl. This is because the class constructor is a static method that is executed automatically before the class is accessed for the first time. The class constructor is used to initialize the static attributes and components of the class. The class constructor of the superclass is executed before the class constructor of the subclass, as the subclass inherits the static components of the superclass12

* Class constructor of subl. This is because the class constructor is a static method that is executed automatically before the class is accessed for the first time. The class constructor is used to initialize the static attributes and components of the class. The class constructor of the subclass is executed after the class constructor of the superclass, as the subclass inherits the static components of the superclass12

* Instance constructor of superl. This is because the instance constructor is an instance method that is executed automatically when an instance of the class is created using the statement CREATE OBJECT.

The instance constructor is used to initialize the instance attributes and components of the class. The instance constructor of the superclass is executed before the instance constructor of the subclass, as the subclass inherits the instance components of the superclass. The instance constructor of the subclass must call the instance constructor of the superclass explicitly using super->constructor, unless the superclass is the root node object12

* Instance constructor of subl. This is because the instance constructor is an instance method that is executed automatically when an instance of the class is created using the statement CREATE OBJECT.

The instance constructor is used to initialize the instance attributes and components of the class. The instance constructor of the subclass is executed after the instance constructor of the superclass, as the subclass inherits the instance components of the superclass. The instance constructor of the subclass must call the instance constructor of the superclass explicitly using super->constructor, unless the superclass is the root node object12

NEW QUESTION # 37

You want to define the following CDS view entity with an input parameter:

Define view entity Z_CONVERT With parameters currency : ???

Which of the following can you use to replace "???" Note: There are 2 correct answers to this question.

- **A. built-in ABAP type**
- B. A component of an ABAP Dictionary structure
- C. A built-in ABAP Dictionary type
- **D. A data element**

Answer: A,D

Explanation:

The possible replacements for "???" in the CDS view entity definition with an input parameter are A. built-in ABAP type and C. A data element. These are the valid types that can be used to specify the data type of an input parameter in a CDS view entity. A built-in ABAP type is a predefined elementary type in the ABAP language, such as abap.char, abap.numc, abap.dec, etc. A data element is a reusable semantic element in the ABAP Dictionary that defines the technical attributes and the meaning of a field¹². For example:

The following code snippet defines a CDS view entity with an input parameter currency of type abap.cuky, which is a built-in ABAP type for currency key:

Define view entity Z_CONVERT With parameters currency : abap.cuky as select from ... { ... } The following code snippet defines a CDS view entity with an input parameter currency of type waers, which is a data element for currency key:

Define view entity Z_CONVERT With parameters currency : waers as select from ... { ... } You cannot do any of the following:

B) A built-in ABAP Dictionary type: This is not a valid type for an input parameter in a CDS view entity. A built-in ABAP Dictionary type is a predefined elementary type in the ABAP Dictionary, such as CHAR, NUMC, DEC, etc. However, these types cannot be used directly in a CDS view entity definition. Instead, they have to be prefixed with abap. to form a built-in ABAP type, as explained above¹².

D) A component of an ABAP Dictionary structure: This is not a valid type for an input parameter in a CDS view entity. A component of an ABAP Dictionary structure is a field that belongs to a structure type, which is a complex type that consists of multiple fields. However, an input parameter in a CDS view entity can only be typed with an elementary type, which is a simple type that has no internal structure¹².

NEW QUESTION # 38

Which of the following string functions are predicate functions? Note: There are 2 correct answers to this question.

- **A. contains_any_of()**
- **B. matchesQ**
- C. find_any_not_of()
- D. count_any_of()

Answer: A,B

Explanation:

String functions are expressions that can be used to manipulate character-like data in ABAP. String functions can be either predicate functions or non-predicate functions. Predicate functions are string functions that return a truth value (true or false) for a condition of the argument text. Non-predicate functions are string functions that return a character-like result for an operation on the argument text¹.

The following string functions are predicate functions:

* B. contains_any_of(): This function returns true if the argument text contains at least one of the characters specified in the character set. For example, the following expression returns true, because the text 'ABAP' contains at least one of the characters 'A', 'B', or 'C':

contains_any_of(val = 'ABAP' set = 'ABC').

* D. matches(): This function returns true if the argument text matches the pattern specified in the regular expression. For example, the following expression returns true, because the text 'ABAP' matches the pattern that consists of four uppercase letters: matches(val = 'ABAP' regex = '[A-Z]{4}').

The following string functions are not predicate functions, because they return a character-like result, not a truth value:

* A. find_any_not_of(): This function returns the position of the first character in the argument text that is not contained in the

character set. If no such character is found, the function returns 0. For example, the following expression returns 3, because the third character of the text 'ABAP' is not contained in the character set 'ABC':

```
find_any_not_of( val = 'ABAP' set = 'ABC' ).
```

* C. count_any_of(): This function returns the number of characters in the argument text that are

* contained in the character set. For example, the following expression returns 2, because there are two characters in the text 'ABAP' that are contained in the character set 'ABC':

```
count_any_of( val = 'ABAP' set = 'ABC' ).
```

NEW QUESTION # 39

The class `zcl_demo_class` is in a software component with the language version set to "Standard ABAP". The function module 'ZF1' is in a software component with the language version set to "ABAP Cloud". Both the class and function module are customer-created. Regarding line #6, which of the following is a valid statement?

- A. 'ZF1' can be called whether it has been released or not for cloud development.
- **B. 'ZF1' can be called via a wrapper that itself has been released for cloud development.**
- C. 'ZF1' must be released for cloud development to be called.
- D. 'ZF1' can be called via a wrapper that itself has not been released for cloud development.

Answer: B

Explanation:

The function module ZF1 is in a software component with the language version set to "ABAP Cloud". This means that it follows the ABAP Cloud Development Model, which requires the usage of public SAP APIs and extension points to access SAP functionality and data. These APIs and extension points are released by SAP and documented in the SAP API Business Hub1. Customer-created function modules are not part of the public SAP APIs and are not released for cloud development. Therefore, calling a function module directly from a class with the language version set to "Standard ABAP" is not allowed and will result in a syntax error.

However, there is a possible way to call a function module indirectly from a class with the language version set to "Standard ABAP":

* Create a wrapper class or interface for the function module and release it for cloud development. A wrapper is a class or interface that encapsulates the function module and exposes its functionality through public methods or attributes. The wrapper must be created in a software component with the language version set to "ABAP Cloud" and must be marked as released for cloud development using the annotation `@EndUserText.label`. The wrapper can then be called from a class with the language version set to "Standard ABAP" using the public methods or attributes2.

For example, the following code snippet shows how to create a wrapper class for the function module ZF1 and call it from the class `zcl_demo_class`:

```
@EndUserText.label: 'Wrapper for ZF1' CLASS zcl_wrapper_zf1 DEFINITION PUBLIC FINAL CREATE PUBLIC. PUBLIC SECTION. CLASS-METHODS: call_zf1 IMPORTING iv_a TYPE i iv_b TYPE i EXPORTING ev_result TYPE i. ENDCLASS.
```

```
CLASS zcl_wrapper_zf1 IMPLEMENTATION. METHOD call_zf1. CALL FUNCTION 'ZF1' EXPORTING a = iv_a b = iv_b IMPORTING result = ev_result. ENDMETHOD. ENDCLASS.
```

```
CLASS zcl_demo_class DEFINITION. METHODS: m1. ENDCLASS.
```

```
CLASS zcl_demo_class IMPLEMENTATION. METHOD m1. DATA(lv_result) =
```

```
zcl_wrapper_zf1=>call_zf1( iv_a = 2 iv_b = 3 ). WRITE: / lv_result. ENDMETHOD. ENDCLASS.
```

The output of this code is:

5

NEW QUESTION # 40

.....

If you want to get promotions or high-paying jobs in the SAP sector, then it is important for you to crack the SAP Certified Associate - Back-End Developer - ABAP Cloud (C-ABAPD-2309) certification exam. The SAP C-ABAPD-2309 certification has become the best way to validate your skills and accelerate your tech career. C-ABAPD-2309 Exam applicants who are doing jobs or busy with their other matters usually don't have enough time to study for the test.
