Save Time And Use Oracle 1Z0-1151-25 PDF Dumps Format For Qucik Preparation

P.S. Free 2025 Oracle 1Z0-1151-25 dumps are available on Google Drive shared by ITexamReview:
https://drive.google.com/open?id=1dLdJPIr2tq_dftcMxQlZRBUv-8jOYovV

It is known to us that our 1Z0-1151-25 study materials are enjoying a good reputation all over the world. Our study materials have been approved by thousands of candidates. You may have some doubts about our product or you may suspect the pass rate of it, but we will tell you clearly, it is totally unnecessary. If you still do not trust us, you can choose to download demo of our 1Z0-1151-25 Test Torrent. The high quality and the perfect service system after sale of our 1Z0-1151-25 exam questions have been approbated by our local and international customers. So you can rest assured to buy.

Oracle 1Z0-1151-25 Exam Syllabus Topics:

Topic	Details
Topic 1	• Introduction to Multicloud: This section of the exam measures the skills of Cloud Architects in understanding multicloud environments and their benefits. It covers the reasons organizations adopt multi-cloud strategies, including flexibility, cost optimization, and risk management. Candidates will learn about common multicloud use cases and how they are implemented in Oracle Cloud Infrastructure (OCI) to enhance interoperability and performance.
Topic 2	• Core OCI Services Overview: This section evaluates the knowledge of Identity and Database Administrators in managing OCI's core services for multi-cloud integration. It covers the implementation of identity federation between OCI Identity Domains and external identity providers, ensuring secure authentication across multiple cloud environments. Candidates will also gain expertise in configuring Virtual Cloud Network (VCN) components and administering OCI database services, including Base Databases, Autonomous Databases, and HeatWave, to support scalable multi-cloud deployments.

Topic 3	• Implement Oracle Database@Google Cloud: This section measures the proficiency of Cloud Database Engineers in utilizing Oracle Database@Google Cloud. It explores the architecture and operational framework for running Oracle databases on Google Cloud. Candidates will learn about onboarding procedures, provisioning resources, and managing database services effectively to optimize performance and availability in a Google Cloud-integrated multi-cloud ecosystem.
Topic 4	• Implement Oracle Database@Azure: This section tests the expertise of Database Solutions Architects in deploying and managing Oracle Database@Azure. It covers the architectural components and onboarding processes required for provisioning databases in Azure while maintaining Oracle's advanced database capabilities. Candidates will also focus on configuring high availability and disaster recovery strategies to ensure business continuity and data resilience in a multi-cloud setup.
Topic 5	• Configure Multicloud Connection Options: This section assesses the abilities of Network Engineers in configuring connectivity solutions for OCI multi-cloud environments. It includes setting up secure networking options such as Site-to-Site VPN and FastConnect for seamless cloud integration. Candidates will also learn how to implement Oracle Interconnect services for establishing direct, high-performance connections between OCI and third-party cloud providers like Microsoft Azure and Google Cloud.

Valid Braindumps 1Z0-1151-25 Questions | 1Z0-1151-25 Exam

Oracle certification exams become more and more popular. The certification exams are widely recognized by international community, so increasing numbers of people choose to take Oracle certification test. Among Oracle certification exams, 1Z0-1151-25 is one of the most important exams. So, in order to pass 1Z0-1151-25 test successfully, how do you going to prepare for your exam? Will you choose to study hard examinations-related knowledge, or choose to use high efficient study materials?

Oracle Cloud Infrastructure 2025 Multicloud Architect Professional Sample Questions (Q25-Q30):

NEW QUESTION # 25
What is the role of BGP dynamic routing in the connection between an Azure VNet and OCI VCN?

- A. It is used to manage the security rules for the VNet and VCN.
- B. It is used to automatically select the best route between the VNet and VCN.
- C. It is used to create a static routing configuration for the VNet and VCN.
- D. It is used to establish a direct connection between the VNet and VCN without a virtual circuit.

Answer: B

Explanation:
Border Gateway Protocol (BGP) is a dynamic routing protocol used in the OCI-Azure Interconnect to automatically determine the optimal path for data between an Azure Virtual Network (VNet) and an OCI Virtual Cloud Network (VCN). Unlike static routing (Option A), BGP adapts to network changes, ensuring efficient and reliable connectivity. It doesn't establish the connection itself (Option B) or manage security rules (Option C)-those are handled by FastConnect/ExpressRoute and security lists, respectively. Oracle's networking documentation for multicloud interconnects confirms BGP's role in route optimization.

NEW QUESTION # 26
which of the following components is primarily responsible for managing the BGP peering and dynamic route exchange between the two cloud environments?

- A. OCI Virtual Cloud Network (VCN) and Google Cloud Interconnect Attachment
- B. OCI Dynamic Routing Gateway (DRG) and Google Cloud Virtual Private Cloud (VPC) Network
- C. OCI FastConnect and Google Cloud Partner Interconnect
- D. OCI Customer-Premises Equipment (CPE) and Google Cloud Router

Answer: D

Explanation:
While the wording is a little tricky (OCI doesn't require physical CPE in this cloud-to-cloud scenario), the concept is correct. Here's why:
OCI's "CPE" in this context: In a traditional on-premises to OCI FastConnect setup, you would have physical CPE (Customer-Premises Equipment) that terminates the FastConnect connection and establishes BGP sessions with the OCI DRG. In a cloud-to-cloud scenario like Oracle Interconnect for Google Cloud, the function of the CPE is handled by Oracle's network infrastructure at the FastConnect edge. So, conceptually, this is the correct side of the equation.
Google Cloud Router: As discussed previously, the Cloud Router is the Google Cloud component specifically designed for BGP routing. It establishes BGP sessions with the corresponding routing entity on the other side (in this case, the FastConnect connection point on the OCI side, acting as the "CPE").
Why the other options are incorrect:
A). OCI Dynamic Routing Gateway (DRG) and Google Cloud Virtual Private Cloud (VPC) Network: The DRG is the central point for routing within OCI, but it doesn't directly handle the BGP peering with Google Cloud. The FastConnect connection (acting as the "CPE") handles that. The VPC is the overall network construct, not the BGP component.
C). OCI Virtual Cloud Network (VCN) and Google Cloud Interconnect Attachment: The VCN is the OCI network itself, and the Interconnect Attachment is a Layer 2 construct. Neither of these are responsible for BGP.
D). OCI FastConnect and Google Cloud Partner Interconnect: FastConnect is the physical/virtual connection, and Partner Interconnect is the overall service. They facilitate the connection, but the BGP sessions are established by the "CPE" function on the OCI side and the Cloud Router on the Google Cloud side.

NEW QUESTION # 27
In the context of Oracle Database@Google Cloud, what is the role of the OCI Dynamic Routing Gateway (DRG)?

- A. It facilitates BGP routing between the OCI FastConnect and the Google Cloud Router for dynamic route exchange.
- B. It provides Network Address Translation (NAT) for the Exadata systems.
- C. It manages the physical cross-connect between the Oracle and Google Cloud networks.
- D. It acts as a firewall controlling traffic between the Exadata systems and Google Cloud VPCs.

Answer: A

Explanation:
The OCI Dynamic Routing Gateway (DRG) is a virtual router that provides a single point of entry for network traffic into and out of the OCI Virtual Cloud Network (VCN). In the context of Oracle Database@Google Cloud, the DRG plays a crucial role in enabling connectivity between the Exadata systems (within OCI) and the Google Cloud VPCs. It does this by:
Connecting to the Oracle FastConnect circuit.
Establishing BGP (Border Gateway Protocol) peering with the Google Cloud Router.
BGP is a dynamic routing protocol that allows the two networks (OCI and Google Cloud) to exchange routing information automatically. This ensures that traffic is routed efficiently between the two environments.
The other options are incorrect:
While security is important, the DRG's primary function in this context is routing, not acting as a firewall. Security is typically handled by security lists and network security groups.
NAT is not the DRG's primary role in this scenario.
The DRG manages the virtual routing, not the physical cross-connect.
The physical connection is handled by the underlying infrastructure of FastConnect and Partner Interconnect.

NEW QUESTION # 28
Which tasks are performed in the Azure portal when using Oracle Database@Azure?

- A. Provisioning container and pluggable databases
- B. Configuring Oracle database homes
- C. Enabling Data Guard for database backups
- D. Managing and maintaining Exadata VM cluster and infrastructure

Answer: D

Explanation:
In Oracle Database@Azure, the Azure portal is used for managing and maintaining Exadata VM clusters and infrastructure, aligning

with its Azure-native management approach. Data Guard (Option A), database homes (Option B), and container/pluggable databases (Option D) are configured post-provisioning, often via database tools, not directly as portal tasks. Oracle's documentation specifies this infrastructure focus in Azure.

NEW QUESTION # 29
How do you ensure that traffic between your OCI VCN and Azure Virtual Network uses the interconnect and not the public internet?

- A. Enable private peering between the VCN and the Virtual Network.
- B. Configure route tables in both OCI and Azure to prioritize routes through the interconnect.
- C. Disable public IP addresses on instances in both environments.
- D. Configure security lists in both OCI and Azure to block traffic over the internet.

Answer: B

Explanation:
Here's why:
Route tables are the core mechanism for controlling network traffic flow within both OCI and Azure. To ensure traffic uses the interconnect (like FastConnect/ExpressRoute), you need to configure the route tables to direct traffic destined for the other cloud provider's address space through the interconnect.
OCI Route Tables: In OCI, you'd create a route rule in your VCN's route table that directs traffic destined for the Azure Virtual Network's address space (e.g., a specific CIDR block) to the Dynamic Routing Gateway (DRG) that is connected to your FastConnect circuit.
Azure Route Tables: In Azure, you'd configure a route in your Virtual Network's route table that directs traffic destined for the OCI VCN's address space to the ExpressRoute gateway.
By configuring these routes, you explicitly tell the networks to use the private, dedicated connection for communication between the two clouds.
Why the other options are not sufficient or correct:
A). Configure security lists in both OCI and Azure to block traffic over the internet: Security lists (or Network Security Groups in Azure) control access based on ports and protocols, but they don't control routing. Blocking internet traffic would prevent instances from accessing the internet, but it wouldn't force traffic to use the interconnect. The routing decision happens before the security list rules are evaluated.
C). Disable public IP addresses on instances in both environments: Disabling public IPs prevents direct internet access to the instances, but it doesn't guarantee that traffic will use the interconnect. Without proper routing, the instances wouldn't be able to communicate with each other at all.
D). Enable private peering between the VCN and the Virtual Network: "Private peering" is a general term and doesn't fully describe the required configuration. While the interconnect is a form of private peering, it's the route table configuration that actually directs traffic over that private connection. Simply enabling the interconnect isn't enough; you must configure the routing.

NEW QUESTION # 30
......

For candidates who want to start learning immediately, choosing us will be your best choice. Because you can get the downloading link within ten minutes after purchasing, so that you can begin your study right now. What's more, 1Z0-1151-25 training materials of us are also high-quality, and they will help you pass the exam just one time. We are pass guaranteed and money back guaranteed for your failure. We also have a professional service stuff to answer any your questions about 1Z0-1151-25 Exam Dumps.
