

Secure 100% Exam Results with AACN CCRN-Pediatric Practice Questions [2025]

CCRN Pediatric Practice Exam Questions from AACN Questions and Answers 100% Verified Latest Update

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
 - B) Encourage the parents to minimize their expression of grief with the sibling
 - C) Explain to the sibling that the infant went to heaven
 - D) Explain to the sibling that thoughts and wishes did not cause the infant's death - Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.
- A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.
- B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes
- C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
- B) the patient having a CT scan followed by possible shunt revision
- C) Administering mannitol or hypertonic saline
- D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx) - Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.

Authentic AACN CCRN-Pediatric Exam Questions & Answers

Success in the AACN CCRN-Pediatric exam paves the way toward high-paying jobs, promotions, and skills verification. Hundreds of AACN CCRN-Pediatric test takers do not get success because of using AACN CCRN-Pediatric outdated dumps. Due to failure, they lose money, time, and confidence. All these losses can be prevented by using updated and real CCRN-Pediatric exam.

AACN Critical Care Nursing Exam Sample Questions (Q89-Q94):

NEW QUESTION # 89

A nurse is caring for a child with diarrhea due to salmonella infection. What order should be questioned by the nurse:

- A. Ciprofloxacin 250 mg tab BID for 5 days
- **B. kaopectate, 1 tsp every bowel movement**
- C. Paracetamol, 5ml for temperature = 37.8°C
- D. ORS I tab dissolve in 150 ml water

Answer: B

Explanation:

Explanation: Kaopectate will keep the stool in the intestines longer which could allow the organism to infect the intestinal mucosa. This drug has adsorbent and demulcent effects.

NEW QUESTION # 90

A 5-month-old infant, weighing 15 lbs, is admitted with a diagnosis of diarrhea with moderate dehydration. The doctor ordered oral rehydration therapy of 40-50 ml/kg of pedialyte over 4 hours.

What would be the appropriate amount of fluid that the infant should ingest during the 4 hour period:

- **A. 330 ml**
- B. 360 ml
- C. 250 ml
- D. 400 ml

Answer: A

Explanation:

Explanation: 15 lbs is about 7 kg; at 40 ml/kg x 4 hours = 280 ml; at 50ml/kg x 4 hours = 350 ml; 330ml is within these parameters.

NEW QUESTION # 91

While ventilating with 100% FiO₂ via Ambu bag, an intubated child desaturates. Breath sounds are decreased in all fields. What is the best action?

- **A. Obtain a chest x-ray and ABG**
- B. Administer a bronchodilator
- C. Continue ventilating with Ambu bag
- D. Extubate and bag-mask ventilate

Answer: A

Explanation:

A sudden drop in oxygen saturation with diminished breath sounds bilaterally suggests a possible ET tube issue, pneumothorax, or mucus plug. A chest x-ray is the most appropriate immediate step to identify the cause, and an ABG can assess ventilation status. "Sudden desaturation in an intubated patient warrants immediate imaging and gas exchange assessment to identify pneumothorax, malpositioned tube, or obstruction." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Emergency Airway Complications)

NEW QUESTION # 92

Which of the following nursing diagnosis would the nurse identify as the priority for a 4-month-old infant with heart failure and congenital heart disease:

- A. risk for infection
- B. ineffective health maintenance
- C. activity intolerance
- D. impaired mobility

Answer: C

Explanation:

Explanation: An infant with congenital heart disease and congestive heart failure tires very easily, leading to a priority nursing diagnosis of Activity Intolerance. Nursing care needs to focus on allowing the infant to have frequent rest periods. Infants with congenital heart disease and congestive heart failure are not necessarily at risk for more infections than other infants. Impaired Mobility usually is not a problem because an infant with congenital heart disease usually exhibits normal physical mobility. Ineffective Health Maintenance usually is not a problem because these infants still need regular and routine health check-ups.

NEW QUESTION # 93

A nurse is aware that findings would differentiate talipes equinovarus as a true clubfoot from a pseudo-clubfoot. A true clubfoot:

- A. will be cooler to touch than the other foot
- B. has little movement
- C. can be rotated past the midline and returns once released
- D. can't be rotated past the midline

Answer: D

Explanation:

Explanation: True clubfoot cannot be rotated past the midline. It is an indication that ligaments, tendons, and bone changes are involved.

NEW QUESTION # 94

.....

Before you try to attend the CCRN-Pediatric practice exam, you need to look for best learning materials to easily understand the key points of CCRN-Pediatric exam prep. There are CCRN-Pediatric real questions available for our candidates with accurate answers and detailed explanations.
