Salesforce Certified Sharing and Visibility Architect Sample Questions (Q51-Q56):

NEW QUESTION # 51
The sales managers at the Universal Containers (UC) requested their teams to define each user's role on their accounts in order to provide an easy way to establish accountability and collaboration. Sales managers also requested that sales associates should only get the following permissions:
Read access to the accounts.
Read access to cases related to the accounts
No access to deals related to the accounts
The sales associates may be granted access to opportunities when needed.
Assuming the overall sharing model of the organization is private and no sharing rules are configured on the account objects. How can an Architect achieve these requirements?

- A. Use Account teams and use Sharing rules to share cases with sales associates. No change required to the opportunity object
- B. Use Account teams, Opportunity teams, and Case teams.
- C. Use Account Teams to define access to accounts as well as opportunities and cases related to accounts
- D. Use Account teams, Case teams. No configuration required for the opportunity object.

Answer: B

Explanation:
Explanation
Using Account teams, Opportunity teams, and Case teams is the best way to achieve these requirements.
Account teams allow you to share accounts and related records with a group of users. Opportunity teams allow you to share opportunities with a group of users who can have different levels of access. Case teams allow you to share cases and related records with a group of users who can have different roles and levels of access.
Using Sharing rules to share cases with sales associates will not work, because sharing rules can only be based on record owner or criteria, not on account team membership. Using Account Teams to define access to accounts as well as opportunities and cases related to accounts will not work, because account team members can only have read-only access to cases by default.

NEW QUESTION # 52
Universal Containers (UC) has a requirement to expose a web service to their business partners. The web service will be used to allow each business partner to query UC's Salesforce instance to retrieve the status of orders. The business partner should only be allowed access to orders for which the business partner is the fulfillment vendor. The Architect does not want the business partners to utilize the standard APIs and would prefer a custom API be developed. Which three design elements should the Architect consider in order to ensure the data security of the solution?
Choose 3 answers

- A. Set the Orders object's sharing settings to Private in the Org-Wide Defaults
- B. Develop a custom Apex web service with a fulfillment ID input attribute
- C. Provide each partner with their own Salesforce login set to API Enabled on the profile.
- D. Query the Orders object with Dynamic SOQL based upon the fulfillment ID.
- E. Develop a custom Apex web service using the "With Sharing" keyword.

Answer: A,D,E

Explanation:
Explanation
To ensure the data security of the custom web service, the Architect should consider the following design elements:
Query the Orders object with Dynamic SOQL based on the fulfillment ID: This will allow the web service to filter the orders based on the input parameter and return only the relevant records to the business partner.
Set the Orders object's sharing settings to Private in the Org-Wide Defaults: This will restrict access to the Orders object to only the owner and users above them in the role hierarchy by default, and prevent unauthorized access from other internal or external users.
Develop a custom Apex web service using the "With Sharing" keyword: This will enforce the sharing rules defined for the Orders object and respect the record-level access of the web service user.

NEW QUESTION # 53

Universal Container is a global Telco that has recently implemented enterprise territory management to better align their sales teams and sales processes. They are in Q4 of the FY and they have completely revamped their territory structure and created a plan for a new structure that would support the new FY. Their current territory model has 8k territories. Their new model would be a new set of 8,5K territories, and their org limit is 10k. What enterprise territory management feature can US take advantage of in order to help them stay within their org limits?

- A. Territory Type
- B. Territory type priority
- C. Territory Model State
- D. Territory Hierarchy

Answer: C

NEW QUESTION # 54

In order to allow community users to collaborate on Opportunities, which license type must the users.

- A. Customer Community
- B. Partner Community
- C. Customer Community plus
- D. Sales Community

Answer: B

NEW QUESTION # 55

Universal Containers (UC) has recently changed its internal policy to follow market regulations and create an internal team to manage the collection process. Only this team should have access to Invoke records. currently, invoke is a child in a Master-Detail relationship to Account. Although related lists have been removed from the page layouts, some profiles stills have access to the invoice object.
Which approach should an architect recommend to fix this problem?

- A. Change the Invoke organization-wide default from Controlled by Parent to Private and remove invoke access from the unauthorized
- B. Replace Account and Invoke Master Detail Relationship by a Lookup and remove Invoice Access from the unauthorized profiles,
- C. Create a new Profile with no access to the Invoice object and assign it to all unauthorized users.
- D. Create a Permission Set with No Access to the Invoice object and assign it to unauthorized users.

Answer: B

Explanation:
Explanation
Master-Detail relationships enforce the sharing and security settings of the parent object on the child object.
This means that if a user has access to an Account record, they will also have access to any Invoice records that are related to that Account. To prevent this, the architect can recommend replacing the Master-Detail relationship with a Lookup relationship, which allows the child object to have its own sharing and security settings independent of the parent object. Then, the architect can remove the Invoice access from the unauthorized profiles or use other mechanisms such as sharing rules or permission sets to restrict or grant

access to the Invoice object. Therefore, the answer C is correct and the other options are incorrect

NEW QUESTION # 56
