With Sitecore-XM-Cloud-Developer test training materials of ExamPrepAway, you will own the key to pass Sitecore-XM-Cloud-Developer exam, which will make you develop better in IT. All of this just need you trust us, trust in ExamPrepAway, and trust in Sitecore-XM-Cloud-Developer test training materials. Our training material of Sitecore-XM-Cloud-Developer exam is absolutely real and reliable. What's more, the passing rate of Sitecore-XM-Cloud-Developer test is as high as 100%.

The Sitecore Sitecore-XM-Cloud-Developer Exam Questions give you a complete insight into each chapter and an easy understanding with simple and quick-to-understand language. The Sitecore Sitecore-XM-Cloud-Developer exam dumps are the best choice to make. The common problem Sitecore Sitecore-XM-Cloud-Developer Exam applicants face is seeking updated and real Sitecore Sitecore-XM-Cloud-Developer practice test questions to prepare successfully for the cherished Sitecore XM Cloud Developer Certification Exam Sitecore-XM-Cloud-Developer certification exam.

Sitecore-XM-Cloud-Developer Detailed Answers - Pass Guaranteed 2025 First-grade Sitecore-XM-Cloud-Developer: Sitecore XM Cloud Developer Certification Exam Certification Training

It is well known that even the best people fail sometimes, not to mention the ordinary people. In face of the Sitecore Sitecore-XM-Cloud-Developer exam, everyone stands on the same starting line, and those who are not excellent enough must do more. If you happen to be one of them, our Sitecore XM Cloud Developer Certification Exam Sitecore-XM-Cloud-Developer Learning Materials will greatly reduce your burden and improve your possibility of passing the exam. Our advantages of time-saving and efficient can make you no longer be afraid of the Sitecore-XM-Cloud-Developer exam.

Sitecore Sitecore-XM-Cloud-Developer Exam Syllabus Topics:

Topic	Details
Topic 1	Sitecore Content Serialization: The topic delves into various ways to serialize and deserialize Sitecore content in XM Cloud applications. This topic also includes understanding JSON, XML, and OData serialization.

Topic 2	• XM Cloud Architecture and Developer Workflow: This topic delves into the basics of XM Cloud, its key components, architecture, and the development workflow to build and deploy applications on XM Cloud.
Topic 3	• Security for Developers: The exam topic is related to security and covers different features. These features help to create secure and trustworthy experiences. Another crucial sub-topic of this security topic is access control. This access control is achieved through robust authentication and authorization mechanisms.
Topic 4	• Renderings and Layout: It covers the creation and usage of renderings. These renderings are the building blocks of user interfaces in different XM Cloud apps.

Sitecore XM Cloud Developer Certification Exam Sample Questions (Q21-Q26):

NEW QUESTION # 21

A developer creates a new data template for a page. How do they ensure that the new template is available through Experience Edge?

- A. Add the parent path of the template to the Experience Edge config using a patch file.
- B. Create the template in the configured locations for Experience Edge (Feature, Foundation, Project, User Defined).
- C. Use the Experience Edge Admin API to add the template to the schema.
- D. Create the template anywhere in the /sitecore/templates folder.

Answer: A

Explanation:

Sitecore Experience Edge is a headless content delivery service that exposes content via GraphQL. For a newly created data template to be available in Experience Edge, it must be explicitly included in the GraphQL content schema configuration. This is done by modifying the Sitecore configuration using a patch file to include the parent path of the template.

* Locate the Parent Path of the Template

* The template must be within a content structure that is included in Experience Edge publishing.

* Modify the Experience Edge Configuration Using a Patch File

* Create a configuration patch file (e.g., include.ExperienceEdge.config) to add the template's parent path under the content section.

* Example patch file:

Steps to Ensure the Template is Available in Experience Edge: <configuration xmlns:patch="http://www.sitecore.net/xmlconfig/">

```
<sitecore>
<experienceedge>
<content>
<include hint="list:AddContentType">
<contentType path="/sitecore/templates/Project/MySite/MyPageTemplate" />
</include>
</content>
</experienceedge>
</sitecore>
</configuration>
```

* This ensures that content based on the new template is published to Experience Edge.

* Publish the Configuration Changes and Content

* Ensure the template and items are published.

* The updated schema should be reflected in the GraphQL endpoint of Experience Edge.

Why are the Other Options Incorrect? #A. Create the template in the configured locations for Experience Edge (Feature, Foundation, Project, User Defined).

* While placing templates in the correct Helix architecture layers (Feature, Foundation, Project) is a best practice, it does not automatically make them available in Experience Edge.

#C. Use the Experience Edge Admin API to add the template to the schema.

* The Admin API does not control content schema inclusion. Experience Edge follows Sitecore publishing rules, and templates must be included via the configuration patch file.

#D. Create the template anywhere in the /sitecore/templates folder.

* Simply creating a template does not make it available in Experience Edge. It must be explicitly added to the Experience Edge content schema configuration.

* Sitecore Experience Edge Configuration- Configuring Content in Experience Edge
* Sitecore GraphQL Content Schema Setup- GraphQL Content Schema
* Using Sitecore Patch Files- Sitecore Configuration Patching

NEW QUESTION # 22

A multinational clothing company wants to create a structured online presence for its various brands and countries. They want to ensure that the different brands and countries have their own dedicated content within the same Sitecore instance. Which approach should they take to achieve this using XM Cloud's content architecture?

- A. Create a separate site for each brand and use a language per country.
- B. Create a single site collection and site for all brands and countries and also manage their resources manually.
- **C. Create individual site collections for each brand and a site for each country.**
- D. Use separate instances of XM Cloud for each brand and country to maintain separation.

Answer: C

Explanation:

XM Cloud's content architecture supports the creation of individual site collections for each brand, with separate sites for each country. This approach allows a multinational company to maintain a structured online presence, ensuring dedicated content for different brands and countries within the same Sitecore instance.

References: The Sitecore XM Cloud documentation outlines the ability to create headless site collections and sites, supporting multiple brands for a single company or multiple languages or locations for a single brand¹. This is part of the SXA content architecture, which includes site collections and sites, allowing for multiple sites on a single instance of Sitecore¹.

NEW QUESTION # 23

The XM Cloud Pages editor comes with a set of devices (for example, Desktop Regular and Mobile) with predefined settings. Which of the following fields must a developer specify to add and configure an additional device?

- A. Device height, visibility, responsive breakpoints
- **B. Device width, visibility, an icon to represent the device**
- C. Device height, visibility, an icon to represent the device
- D. Device width, visibility, responsive breakpoints

Answer: B

Explanation:

When adding and configuring an additional device in the XM Cloud Pages editor, a developer must specify the device width in pixels, the visibility options (Disabled, Fixed, Optional), and an icon to represent the device. These settings are crucial for simulating how content will appear on different devices within the Pages editor.

References: The Sitecore XM Cloud documentation provides detailed instructions on adding and configuring devices in the Pages editor, including specifying the device width, visibility options, and selecting an icon¹.

NEW QUESTION # 24

A developer is working on managing environments within the XM Cloud Deploy app. They have created a new environment for the project and linked it to a specific repository branch. However, they realize that they need to change the linked repository branch due to new developments in the project. Which steps should they follow to achieve this?

- A. Unlink the current repository branch and then relink the desired branch to the environment through the project's "Options" menu.
- **B. Go to the project page, click the environment, choose "Options," and then "Edit environment details." In the dialog, select the desired branch from the "Link to branch" drop-down menu and save the changes.**
- C. Delete the current environment and create a new one with the desired repository branch.
- D. Link the desired branch to the environment directly from the repository settings. The XM Cloud Deploy app will automatically update the linked branch.

Answer: B

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, you can link an environment to a specific branch of your repository in the XM Cloud Deploy app. This allows you to deploy different versions of your code to different environments. To change the linked branch for an existing environment, you need to follow these steps²:

On the navigation pane of the XM Cloud Deploy app, click Projects.

On the Projects page, click the project that contains the environment where you want to change the linked branch.

On the project page, click the environment where you want to change the linked branch.

On the environment page, click Options, then click Edit environment details.

In the Edit environment details dialog, select the desired branch from the Link to branch drop-down menu.

Click Save to confirm your changes.

2:Manage an environment in the XM Cloud Deploy app | Sitecore Documentation¹:XM Cloud Documentation for Developers - Sitecore

NEW QUESTION # 25

Why should a developer assign security to roles instead of users when setting up security on a site?

- A. Role-based security allows multiple users to have the same username.
- B. Security roles can assign individual rights and permissions to be configured by users.
- C. Individual users with a role can set and configure their own item security permissions.
- **D. Security can be managed more efficiently as the rights and permissions apply to a group of users.**

Answer: D

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, security roles define how different users access different types of records in Sitecore. To control access to data and resources, you can create or modify security roles and change the security roles that are assigned to your users. A user can have multiple security roles. Security role privileges are cumulative. Users are granted the privileges that are available in each role that's assigned to them².

This makes it easier for you to manage your security system because you do not necessarily have to assign access rights for each item in your content tree. Instead, you only need to assign and manage the access rights on the parent items and then specify whether their descendants can inherit these access rights³.

NEW QUESTION # 26

.....

Many clients may worry that their privacy information will be disclosed while purchasing our Sitecore-XM-Cloud-Developer quiz torrent. We promise to you that our system has set vigorous privacy information protection procedures and measures and we won't sell your privacy information. Before you buy our product, you can download and try out it freely so you can have a good understanding of our Sitecore-XM-Cloud-Developer Quiz prep. Please feel safe to purchase our Sitecore-XM-Cloud-Developer exam torrent any time as you like. We provide the best service to the client and hope the client can be satisfied.
