Sitecore Sitecore-XM-Cloud-Developer Valid Test Review - Exam Sitecore-XM-Cloud-Developer Blueprint

As we all know, it is difficult to prepare the Sitecore-XM-Cloud-Developer exam by ourselves. Excellent guidance is indispensable. If you urgently need help, come to buy our study materials. Our company has been regarded as the most excellent online retailers of the Sitecore-XM-Cloud-Developer exam question. So our assistance is the most professional and superior. You can totally rely on our study materials to pass the exam. All the key and difficult points of the Sitecore-XM-Cloud-Developer exam have been summarized by our experts. They have rearranged all contents, which is convenient for your practice. Perhaps you cannot grasp all crucial parts of the Sitecore-XM-Cloud-Developer Study Tool by yourself. You also can refer to other candidates' review guidance, which might give you some help. Then we can offer you a variety of learning styles. Our printable Sitecore-XM-Cloud-Developer real exam dumps, online engine and windows software are popular among candidates. So you will never feel bored when studying on our Sitecore-XM-Cloud-Developer study tool.

Sitecore XM Cloud Developer Certification Exam Sample Questions (Q25-Q30):

NEW QUESTION # 25

A developer changed the CSS grid system after a site was created. Which of the following can happen due to references to the previous grid system?

- A. The changes break the layout of the site.
- B. The new grid was automatically added as one of the grid options.
- C. A new custom theme with a grid definition item was created.
- D. The Grid Setup item and its dependencies were automatically updated.

Answer: A

Explanation:

Changing the CSS grid system after a site has been created can lead to broken layouts due to references to the previous grid system. This is because grid systems have specific rules, classes, and options that are not automatically updated or compatible with the new system, requiring manual changes to ensure the layout functions correctly.

References: The Sitecore XM Cloud documentation provides insights into the implications of changing the grid system, emphasizing the need for manual updates to avoid breaking the site layout.

NEW QUESTION # 26

A developer wants to add a new language to a headless SXA site. Which steps are required to add a new language in XM Cloud?

- A. They must enter the country code in the Language field. Then, on the content item, change the language dropdown to the

new language and add a new version.

- B. Add language in /sitecore/system/languages, right click the site root, and go to scripts -> Add Site language.
- C. Install a language pack on the Content Management instance and then add the language in /sitecore/system/languages.
- **D. Add language in /sitecore/system/languages. Then, on the content item, change the language dropdown to the new language and add a new version.**

Answer: D

Explanation:

When adding a new language to headless SXAsite in Sitecore XM Cloud, there are specific steps that must be followed to ensure content is available in the new language and can be managed effectively in the content tree.

* Add the Language in /sitecore/system/languages: The first step is to add the new language to Sitecore's language settings. This is done in the /sitecore/system/languages node, where you can define the new language and its associated country code (e.g., English - US, French - FR).

* This step ensures that the language is recognized across the Sitecore instance, allowing content and components to be available in that language.

* Change Language on Content Items and Add a New Version: Once the language is added, the next step is to ensure that the new language is applied to specific content items.

* In the Content Editor, select the content item and change the language dropdown to the newly added language.

* After switching the language, you will need to create a new version of the content item in that language, so the content is ready for translation or localization.

* Option A: Installing a language pack is not required in Sitecore XM Cloud for adding a language. This is typically more relevant for traditional Sitecore instances where language packs provide content and translation support. XM Cloud doesn't require a language pack to add new languages.

* Option C: The "Add Site language" option in Sitecore is not a standard action for adding a language to a site. This feature is not part of the typical process for adding a language in the Sitecore Content Management system.

* Option D: The "country code in the Language field" step is not necessary in Sitecore. The language is added through the /sitecore/system/languages node, and country codes are generally tied to the language code but not entered manually in the Language field.

Steps to Add a New Language Why Other Options Are Incorrect: Thus, the correct process is to add the language in /sitecore/system/languages, change the language of the content item, and add a version for that language.

* Managing Languages in Sitecore XM Cloud: <https://doc.sitecore.com/xmc/en/developers/xm-cloud/multilingual-content-in-xm-cloud.html>

* Sitecore SXA and Headless Development: <https://doc.sitecore.com/xmc/en/developers/xm-cloud/sxa-in-xm-cloud.html>

NEW QUESTION # 27

A developer is creating a component that has the following requirements:

- *Image Left, Title, Call to action
- *Image Right, Title, Call to action
- *Image Centered, Call to action

The component should be able to display the same content in all three options. What is the best way to build this?

- A. One component with logic in the component to change the view
- B. Three separate components with the compatible renderings set
- C. One component with three Headless variants
- **D. One component with rendering parameters to control the layout**

Answer: D

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, rendering parameters are a way to define custom properties for a component that can be changed by the content author in the XM Cloud Pages editor. Rendering parameters allow you to create flexible and reusable components that can adapt to different scenarios and layouts. To create a component with rendering parameters, you need to follow these steps²:

Create a data template that defines the rendering parameters for your component. For example, you can create a data template with a field called Layout that has three options: Left, Right, and Center.

Create a component that uses the data template as its rendering parameter template. For example, you can create a component called Image and Text that has an image, a title, and a call to action button.

In the component's code, use the rendering parameter value to control the layout of the component. For example, you can use conditional logic or CSS classes to change the position of the image based on the Layout value. Register the component in the Components builder and add it to the Components library. In the XM Cloud Pages editor, drag and drop the component to the page and use the Properties panel to change the rendering parameter value. For example, you can select Left, Right, or Center from the Layout drop-down menu.

2:Create a component with rendering parameters | Sitecore Documentation1 :XM Cloud Documentation for Developers - Sitecore

NEW QUESTION # 28

When a developer designates a Sitecore template field multilist type, what should they do next?

- A. Add the list items to the multilist item.
- B. Add standard values to the item.
- C. Set the multilist list item's data source.
- D. Add a multilist field to the template.

Answer: C

Explanation:

After designating a Sitecore template field as a multilist type, the next step is to set the data source for the multilist. This involves specifying the location within the content tree from which the list items will be drawn.

The data source defines the scope of items that can be selected and displayed in the multilist.

References:The Sitecore XM Cloud documentation provides guidance on configuring selection fields, including multilists.It details how to control the list of items by setting the Source property, which determines the items that appear in the selection list1. Additionally, developers can use the Sitecore.Data.Fields.

MultilistField class to manage the items in a multilist field, including setting the data source2.

NEW QUESTION # 29

A developer is updating the security access rights for a new role in the Security Editor. Which of the following permissions are they able to manage? Select all that apply.

- A. Write
- B. Access
- C. Debug
- D. Inheritance
- E. Read

Answer: A,B,D,E

Explanation:

In Sitecore XM Cloud, the Security Editor is used to manage user roles and security access rights. Developers can configure permissions for various Sitecore items, templates, and components using this tool.

Permissions Managed in Security Editor

Permission

Description

Read#

Grants the ability to view an item in Sitecore.

Write#

Allows editing and saving changes to an item.

Access#

Controls whether a user can navigate or interact with an item.

Inheritance#

Determines if security settings are inherited from parent roles/items.

Debug#

Not a security permission; debugging is controlled in Sitecore's developer tools.

* Write (#)# Allows users to modify item content.

* Access (#)# Controls user access at different levels.

* Read (#)# Grants viewing permissions.

* Inheritance (#)# Determines whether security settings cascade down from parent roles/items.

* Debug (#) is not a permission managed in the Security Editor. Debugging capabilities are controlled via developer settings and roles, not security permissions.

- * Sitecore Security Editor Guide
- * Understanding Sitecore Access Rights
- * Managing Roles and Permissions in Sitecore

Why These Answers Are Correct? Why "Debug" Is Incorrect? Relevant XM Cloud Documentation References:
