Persistence and proficiency made our experts dedicated in this line over so many years. Their passing rates are over 98 and more, which is quite riveting outcomes. After using our SK0-005 practice materials, you will have instinctive intuition to conquer all problems and difficulties in your review. We are sure you can seep great deal of knowledge from our SK0-005 practice materials in preference to other materials obviously. These SK0-005 practice materials have variant kinds including PDF, app and software versions.

CompTIA Server+ certification is recognized globally and is a vendor-neutral certification. This means that it is not tied to any specific vendor or technology, making it an ideal certification for IT professionals who work in a multi-vendor environment. CompTIA Server+ Certification Exam certification is also accredited by ANSI and is recognized by major IT companies such as Dell, HP, and IBM.

CompTIA Server+ certification is ideal for IT professionals who are responsible for maintaining and managing server infrastructure. This includes system administrators, network administrators, IT technicians, and support specialists. CompTIA Server+ Certification Exam certification validates the candidate's knowledge and skills in installing, configuring, and troubleshooting servers, as well as managing and maintaining server hardware, software, and storage.

SK0-005 Exam Format | SK0-005 Latest Guide Files

There are many merits of our product on many aspects and we can guarantee the quality of our SK0-005 practice engine. Firstly, our experienced expert team compile them elaborately based on the real exam. Secondly, both the language and the content of our SK0-005 study materials are simple. The content emphasizes the focus and seizes the key to use refined SK0-005 Questions and answers to let the learners master the most important information by using the least practic. Three, we provide varied functions to help the learners learn our study materials and prepare for the exam.

CompTIA SK0-005, also known as the CompTIA Server+ Certification exam, is a vendor-neutral certification that is designed to validate the knowledge and skills of IT professionals who work with servers. SK0-005 Exam covers a range of topics related to server hardware, software, storage, networking, and security, and is designed to ensure that professionals have the necessary skills to maintain, troubleshoot, and manage servers in a variety of environments.

CompTIA Server+ Certification Exam Sample Questions (Q344-Q349):

NEW QUESTION # 344

An administrator needs to disable root login over SSH. Which of the following files should be edited to complete this task?

- A. `/etc/ssh/sshd_config`

- B. /root.ssh/sshd/config
- C. /etc.sshs_shd_config
- D. /root.ssh/ssh_config

Answer: A

Explanation:

To disable root login over SSH, the server administrator needs to edit the SSH configuration file located at /etc/ssh/sshd_config. This file contains various settings for the SSH daemon that runs on the server and accepts incoming SSH connections. The administrator needs to find the line that says PermitRootLogin and change it to no or comment it out with a # symbol. Then, the administrator needs to restart the SSH service for the changes to take effect. References: <https://www.howtogeek.com/828538/how-and-why-to-disable-root-login-over-ssh-on-linux/>

NEW QUESTION # 345

A technician is unable to access a server's package repository internally or externally. Which of the following are the MOST likely reasons? (Choose two.)

- A. The external firewall is blocking access
- B. The technician does not have sufficient privileges
- C. The local system log file is full
- D. The system time is not synchronized
- E. The default gateway is incorrect
- F. The server has an architecture mismatch

Answer: A,E

Explanation:

The most likely reasons why the technician is unable to access a server's package repository internally or externally are that the external firewall is blocking access and that the default gateway is incorrect.

A package repository is a source of software packages that can be installed or updated on a server using a package manager tool. A package repository can be accessed over a network using a URL or an IP address.

However, if there are any network issues or misconfigurations, the access to the package repository can be blocked or failed. An external firewall is a device or software that controls the incoming and outgoing network traffic based on predefined rules or policies. An external firewall can block access to a package repository if it does not allow traffic on certain ports or protocols that are used by the package manager tool. A default gateway is a device or address that routes network traffic from one network to another network. A default gateway can be incorrect if it does not match the actual device or address that connects the server's network to other networks, such as the internet. An incorrect default gateway can prevent the server from reaching the package repository over other networks.

NEW QUESTION # 346

The HIDS logs on a server indicate a significant number of unauthorized access attempts via USB devices at startup. Which of the following steps should a server administrator take to BEST secure the server without limiting functionality?

- A. Disable all the USB ports on the server.
- B. Set a BIOS/UEFI password on the server.
- C. Change the boot order on the server and restrict console access.

C Configure the host OS to deny login attempts via USB.

Answer: C

Explanation:

Changing the boot order on the server and restricting console access would prevent unauthorized access attempts via USB devices at startup, as the server would not boot from any external media and only authorized users could access the console. Setting a BIOS/UEFI password on the server would also help, but it could be bypassed by resetting the CMOS battery or using a backdoor password. Configuring the host OS to deny login attempts via USB would not prevent booting from a malicious USB device that could compromise the system before the OS loads. Disabling all the USB ports on the server would limit functionality, as some peripherals or devices may need to use them. References:

NEW QUESTION # 347

The management team has mandated the use of data-at-rest encryption on all corporate servers. Using this encryption paradigm will ensure:

- A. website traffic is protected while traversing the internet.
- B. databases in use are protected from remote hackers.
- **C. files stored on the server are protected against physical theft.**
- D. attachments that are emailed from this server cannot be intercepted.

Answer: C

Explanation:

Explanation

Data-at-rest encryption is a method of encrypting data while it is stored on a storage device, such as a hard drive, an SSD, or a tape library. This ensures that if the data is stolen or lost, it will be unreadable without the encryption key. Data-at-rest encryption does not protect data while it is in transit over the network, in use by the CPU or memory, or attached to an email.

NEW QUESTION # 348

An organization implements split encryption keys for sensitive files. Which of the following types of risks does this mitigate?

- A. Data corruption
- B. Marware
- **C. Insider threat**
- D. Hardware failure

Answer: C
