Free PDF Quiz 2025 Valid CompTIA SK0-005 Reliable Practice Questions

As the tech industry continues to evolve and adapt to new technologies, professionals who hold the CompTIA Server+ Certification Exam (SK0-005) certification are better equipped to navigate these changes and stay ahead of the curve, increasing their value to employers and clients. In today's fast-paced and ever-changing CompTIA sector, having the CompTIA Server+ Certification Exam (SK0-005) certification has become a necessary requirement for individuals looking to advance their careers and stay competitive in the job market.

CompTIA SK0-005 Exam covers a range of topics, including server architecture, storage systems, networking, virtualization, security, troubleshooting, and disaster recovery. SK0-005 exam consists of 90 multiple-choice questions that need to be completed within 90 minutes. The passing score for the exam is 750 out of 900.

CompTIA SK0-005 certification exam is an excellent choice for IT professionals who want to enhance their career prospects in server administration. CompTIA Server+ Certification Exam certification demonstrates that the candidate has the necessary skills and knowledge to manage and maintain server environments, making them a valuable asset to any organization. Additionally, the certification is globally recognized, which means that IT professionals can work in different countries and industries with this certification.

CompTIA Server+ Certification Exam Sample Questions (Q113-Q118):

NEW QUESTION # 113

A server administrator is setting up a new payroll application. Compliance regulations require that all financial systems logs be stored in a central location. Which of the following should the administrator configure to ensure this requirement is met?

- A. Retention
- B. Shipping
- C. Alerting

- D. Rotation

Answer: B

Explanation:

Shipping is a process of sending logs from one system to another system for centralized storage and analysis.

Shipping can help ensure compliance with regulations that require financial systems logs to be stored in a central location. Shipping can also help improve security, performance, and scalability of log management.

NEW QUESTION # 114

Which of the following BEST describes a disaster recovery site with a target storage array that receives replication traffic and servers that are only powered on in the event of a disaster?

- A. Cloud
- B. Cold
- C. Hot
- D. Warm

Answer: D

Explanation:

A warm site is a type of disaster recovery site that has a target storage array that receives replication traffic and servers that are only powered on in the event of a disaster. A warm site is a compromise between a hot site and a cold site. A warm site has some equipment and data ready, but requires some configuration and restoration before resuming operations. A warm site is usually located in a different geographic area than the primary site and has redundant power, cooling, network, and security systems. A warm site is suitable for organizations that can tolerate some downtime and data loss in case of a disaster. A cloud site is a type of disaster recovery site that uses cloud-based resources and platforms to store backups and restore data and applications after a disaster. A cold site is a type of disaster recovery site that has only basic infrastructure and space available, but requires significant setup and installation before resuming operations. A hot site is a type of disaster recovery site that has all the equipment and data ready to resume operations as soon as possible after a disaster. References: <https://www.techopedia.com/definition/11172/hot-site> <https://www.techopedia.com/definition/11173/warm-site> <https://www.techopedia.com/definition/11174/cold-site> <https://www.techopedia.com/definition/29836/cloud-recovery>

NEW QUESTION # 115

A server administrator has received calls regarding latency and performance issues with a file server. After reviewing all logs and server features the administrator discovers the server came with four Ethernet ports, but only one port is currently in use. Which of the following features will enable the use of all available ports using a single IP address?

- A. Network address translation
- B. Round robin
- C. NIC teaming
- D. in-band management

Answer: C

Explanation:

Explanation

NIC teaming is a feature that allows the use of multiple network interface cards (NICs) as a single logical interface with a single IP address. It can improve the network performance, bandwidth, and redundancy of a server. Verified References: [NIC teaming], [Network interface card]

NEW QUESTION # 116

A systems administrator is trying to determine why users in the human resources department cannot access an application server. The systems administrator reviews the application logs but does not see any attempts by the users to access the application. Which of the following is preventing the users from accessing the application server?

- A. VLAN
- B. ICMP
- C. NAT
- D. NIDS

Answer: A

Explanation:

This is the most likely cause of preventing the users from accessing the application server because a VLAN is a logical segmentation of a network that isolates traffic based on certain criteria. If the human resources department and the application server are on different VLANs, they will not be able to communicate with each other unless there is a router or a switch that can route between VLANs. References: <https://www.cisco.com/c/en/us/support/docs/lan-switching/inter-vlan-routing/41860-howto-L3-intervlanrouting.html>

NEW QUESTION # 117

A security analyst completed a port scan of the corporate production-server network. Results of the scan were then provided to a systems administrator for immediate action. The following table represents the requested changes:

Server name	Block	Do not change
MailSrv	20, 21, 22, 23, 53	25, 3389
WebSrv	20, 21, 22, 23, 53	80, 443, 3389
SQLSrv	20, 21, 22, 23, 53	1443, 3389
DNSSrv	20, 21, 22, 23, 53	67, 68, 3389

The systems administrator created local firewall rules to block the ports indicated above. Immediately, the service desk began receiving calls about the internet being down. The systems administrator then reversed the changes, and the internet became available again. Which of the following ports on DNSSrv must remain open when the firewall rules are reapplied?

- A. 0
- B. 1
- C. 2
- D. 3
- E. 4

Answer: D

Explanation:

Port 53 is the standard port for DNS (Domain Name System) queries and responses. DNS is a service that translates domain names (such as www.example.com) into IP addresses (such as 192.0.2.1) and vice versa. DNS is essential for internet connectivity, as it allows users and applications to access websites and other online resources by using human-readable names instead of numerical addresses.

The DNSSrv server is a DNS server that provides name resolution for the corporate network. If port 53 is blocked on this server, it will not be able to communicate with other DNS servers or clients, and the name resolution will fail. This will prevent users from accessing any websites or online services that rely on domain names, such as web browsers, email clients, or cloud applications. Therefore, port 53 must remain open on DNSSrv to allow DNS traffic to flow.
