CompTIA Server+ Certification Exam Sample Questions (Q420-Q425):

NEW QUESTION # 420

An administrator is configuring a host-based firewall for a server. The server needs to allow SSH, FTP, and LDAP traffic. Which of the following ports must be configured so this traffic will be allowed? (Select THREE).

- A. 0
- **B. 1**
- C. 2
- D. 3
- E. 4

- F. 5
- G. 6
- H. 7

Answer: B

NEW QUESTION # 421

An administrator has been asked to disable CPU hyperthreading on a server to satisfy a licensing issue. Which of the following best describes how the administrator will likely perform this action?

- A. Use a PowerShell/Bash script.
- B. Modify the startup configuration.
- C. Use a RDP/VNC session.
- **D. Use the BIOS/UEFI setup.**

Answer: D

Explanation:

The BIOS (Basic Input/Output System) or UEFI (Unified Extensible Firmware Interface) setup is a program that allows users to configure the hardware settings of a computer, such as the CPU, memory, disk, and boot options. The BIOS/UEFI setup can be accessed by pressing a specific key (such as F2, F10, or Delete) during the boot process, before the operating system loads¹². One of the settings that can be changed in the BIOS/UEFI setup is the CPU hyperthreading option. Hyperthreading is a technology that enables a single physical CPU core to execute two threads or tasks simultaneously, improving the performance and efficiency of multi-threaded applications. However, some software licenses may limit the number of CPU cores or threads that can be used, and therefore require disabling hyperthreading on the server³⁴.

To disable hyperthreading on a server, the administrator will likely need to enter the BIOS/UEFI setup and navigate to the processor options menu. There, the administrator will find a setting for Intel Hyperthreading Technology or Hyperthreading Function, which can be enabled or disabled. The administrator will need to disable this setting and save the changes. This will turn off hyperthreading on the server and reduce the number of logical CPUs to match the number of physical cores⁵.

NEW QUESTION # 422

A snapshot is a feature that can be used in hypervisors to:

- **A. perform a backup restore.**
- B. roll back firmware updates.
- C. restore to a previous version.
- D. roll back application drivers.

Answer: A

Explanation:

Hypervisor-based snapshots provide a way to take an image copy of a virtual machine (VM), either to access and restore individual files, provide a rollback point to restore the VM, or to clone the VM to another virtual machine.

NEW QUESTION # 423

An administrator discovers a Bash script file has the following permissions set in octal notation;

777

Which of the following is the MOST appropriate command to ensure only the root user can modify and execute the script?

- A. `chmod u+wx`
- **B. `chmod go-rw>;`**
- C. `chmod u=rwx`
- D. `chmod g-rwx`

Answer: B

Explanation:

`chmod` is a command-line tool that changes the permissions of files and directories in Linux and Unix systems. `chmod go-rwx` means
