Supermicro MI300X GPU Service Specialist (SMI300XS) Exam Sample Questions (Q13-Q18):

NEW QUESTION # 13

In the example system configuration shown in the video, is there an AOM card in the right AOM bracket?

- A. Yes
- **B. No**
- C. I didn't watch the video
- D. Maybe

Answer: B

Explanation:

The AOM (Add-On Module) bracket is used to mount optional components like:

- * RAID controllers
- * Additional networking interfaces
- * BMC/IPMI modules

In the example system shown in the video, the right AOM bracket does not contain an AOM card. This is because:

- * Supermicro's default system configurations do not always ship with optional AOM cards.
- * The left AOM bracket usually houses optional RAID or networking expansions, but the right bracket remains unoccupied unless a specific expansion module is installed.

Official Documentation Reference:

- * Supermicro Hardware Deployment Guide confirms that the right AOM bracket is optional and not pre-installed in base configurations.

NEW QUESTION # 14

To disengage a PCIe, motherboard, or GPU tray on the AS-8125GS-TNMR2 system, loosen the screws on either side of the tray, then slowly pull the tray out to disengage it. True or False?

- A. False
- **B. True**

Answer: B

Explanation:

Why Must the Screws Be Loosened First?

- * The PCIe, motherboard, and GPU trays in Supermicro MI300X systems are secured by screws on both sides to ensure:
- * Structural stability
- * Vibration resistance
- * Secure connection of PCIe lanes and data paths

Proper Tray Removal Process:

#Step 1: Identify the tray to be removed (PCIe, motherboard, or GPU). #Step 2: Loosen screws on both sides to release tension on the tray. #Step 3: Slowly and evenly pull the tray out to avoid damaging connectors. #Step 4: Support the tray from the bottom while sliding it out to prevent bending.

Why This Method Is Important?

- * Preventing Connector Damage# Pulling the tray without loosening screws could damage PCIe connectors or misalign the board.
- * Avoiding Strain on Other Components# A stuck tray could put pressure on adjacent cables and connectors.
- * Ensuring a Safe Removal# The slow and controlled movement reduces the risk of accidentally dropping or flexing the tray.

Why False Is Incorrect?

- * If False were correct, it would suggest that the tray can be removed without loosening screws, which is not possible due to the secure mounting system.

Official Documentation Reference:

- * Supermicro AS-8125GS-TNMR2 Hardware Maintenance Guide confirms that loosening screws and carefully pulling the tray out is the correct disengagement procedure.

NEW QUESTION # 15

Exhibit:

When installing the midplane bracket back into the chassis, what design feature in the chassis helps you properly align the midplane bracket?

- A. Guide stickers in the chassis
- **B. Grooves in the chassis**
- C. Arrows in the chassis
- D. Velcro in the chassis

Answer: B

Explanation:

Why Do Supermicro Systems Use Grooves for Alignment?

In Supermicro MI300X systems, the midplane bracket is aligned using built-in grooves in the chassis.

- * Ensures Perfect Alignment
- * The midplane must line up perfectly with power, PCIe, and data connections.
- * Grooves act as physical guides, ensuring precise placement without guesswork.
- * Prevents Installation Errors
- * Without grooves, technicians might install the midplane slightly misaligned, leading to connection failures.
- * Ensures PCIe and MCIO lanes align correctly, preventing signal loss.
- * Supports a Tool-Free Installation
- * Grooves allow drop-in installation, reducing manual adjustments.
- * Minimizes risk of flexing or damaging the midplane PCB.

Why Other Options Are Incorrect?

- * A (Guide stickers in the chassis) # Stickers may be present for labeling but do not physically align the midplane.
- * C (Arrows in the chassis) # Arrows are visual indicators only, not physical alignment tools.
- * D (Velcro in the chassis) # Velcro is not used in midplane installation.

Official Documentation Reference:

- * Supermicro AS-8125GS-TNMR2 Hardware Guide explicitly states that grooves in the chassis help with midplane bracket alignment.

NEW QUESTION # 16

You must remove the motherboard tray from the chassis before you can access the NVMe backplane.
True or False?

- A. False
- **B. True**

Answer: B

Explanation:

In Supermicro MI300X GPU systems, the NVMe backplane is located behind the motherboard tray, meaning the tray must be removed first.

Why is this step necessary?

- * The NVMe backplane is physically secured behind the motherboard tray to support high-speed PCIe connectivity.
- * Removing the motherboard tray provides clear access to NVMe connectors and M.2 cables.
- * Skipping this step may cause unnecessary strain on cables, leading to potential connector damage.

Official Documentation Reference:

- * Supermicro Service Guide for NVMe Systems confirms that the motherboard tray must be removed first before working on the NVMe backplane.

NEW QUESTION # 17

Why is there a yellow warning label on the flat panel/ribbon cable?

- A. To warn you that you can optionally remove the flat panel cable before removing the midplane from the chassis or you will damage the cable.
- B. To warn you that the cable is hot.
- C. To warn you that you must remove the flat panel cable after removing the midplane from the chassis or you will damage the cable.
- D. To warn you that you must remove the flat panel/ribbon cable before removing the midplane from the chassis or you will damage the cable.

Answer: D
