

SOA-C02 Valid Braindumps Questions - SOA-C02 Exam Overview

BONUS!!! Download part of VCE4Dumps SOA-C02 dumps for free: <https://drive.google.com/open?id=1IwgN9jM4fQqd4Ybqp9BEcFyNRtEJ3vVK>

Usually, the questions of the real exam are almost the same with our SOA-C02 exam questions. So you just need to memorize our correct questions and answers of the SOA-C02 study materials. You absolutely can pass the exam. Also, we will offer good service to add you choose the most suitable SOA-C02 Practice Braindumps since we have three different versions of every exam product. And you can free download the demos of the SOA-C02 learning quiz.

Achieving the Amazon SOA-C02 Certification can help professionals demonstrate their skills and knowledge in operating and managing AWS-based applications and infrastructure. AWS Certified SysOps Administrator - Associate (SOA-C02) certification can also help professionals advance their careers and increase their earning potential by demonstrating their expertise in AWS.

SOA-C02 Exam Overview - New SOA-C02 Test Online

We can claim that prepared with our SOA-C02 study materials for 20 to 30 hours, you can easy pass the SOA-C02 exam and get your expected score. Also we offer free demos of our SOA-C02 exam questions for you to check out the validity and precise of our SOA-C02 Training Materials. Just come and have a try! You will be surprised to find the high accuracy of our SOA-C02

training material. And as our high pass rate of SOA-C02 practice braindump is 99% to 100%, you will pass the exam easily.

Amazon SOA-C02 certification exam covers a wide range of topics, including deployment, management, and optimization of AWS services, as well as monitoring and troubleshooting of AWS systems. Candidates will also be tested on their knowledge of security, compliance, and automation techniques for AWS environments. SOA-C02 Exam consists of 65 multiple-choice and multiple-response questions and has a duration of 130 minutes.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q97-Q102):

NEW QUESTION # 97

A recent audit found that most resources belonging to the development team were in violation of patch compliance standards. The resources were properly tagged.

Which service should be used to quickly remediate the issue and bring the resources back into compliance?

- **A. AWS Systems Manager**
- B. Amazon Inspector
- C. AWS Config
- D. AWS Trusted Advisor

Answer: A

Explanation:

<https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-compliance-about.html>

NEW QUESTION # 98

A SysOps administrator is creating an Amazon EC2 Auto Scaling group in a new AWS account.

After adding some instances, the SysOps administrator notices that the group has not reached the minimum number of instances. The SysOps administrator receives the following error message:

Launching a new EC2 instance. Status Reason: Your quota allows for 0 more running instance(s).

You requested at least 1. Launching EC2 instance failed.

Which action will resolve this issue?

- A. Use the Rebalance action In the Auto Scaling group on the AWS Management Console.
- B. Adjust the account spending limits for Amazon EC2 on the AWS Billing and Cost Management console
- C. Modify the EC2 quota for that AWS Region in the EC2 Settings section of the EC2 console.
- **D. Request a quota Increase for the Instance type family by using Service Quotas on the AWS Management Console.**

Answer: D

NEW QUESTION # 99

A company is running a serverless application on AWS Lambda The application stores data in an Amazon RDS for MySQL DB instance Usage has steadily increased and recently there have been numerous "too many connections" errors when the Lambda function attempts to connect to the database The company already has configured the database to use the maximum max_connections value that is possible What should a SysOps administrator do to resolve these errors?"

- A. Update the Lambda function's reserved concurrency to a higher value
- B. Create a read replica of the database Use Amazon Route 53 to create a weighted DNS record that contains both databases
- C. Increase the value in the max_connect_errors parameter in the parameter group that the database uses
- **D. Use Amazon RDS Proxy to create a proxy Update the connection string in the Lambda function**

Answer: D

Explanation:

Reference:

<https://aws.amazon.com/blogs/compute/using-amazon-rds-proxy-with-aws-lambda/> RDS Proxy acts as an intermediary between your application and an RDS database. RDS Proxy establishes and manages the necessary connection pools to your database so that your application creates fewer database connections. Your Lambda functions interact with RDS Proxy instead of your database

instance. It handles the connection pooling necessary for scaling many simultaneous connections created by concurrent Lambda functions. This allows your Lambda applications to reuse existing connections, rather than creating new connections for every function invocation.

Check "Database proxy for Amazon RDS" section in the link to see how RDS proxy help Lambda handle huge connections to RDS MySQL <https://aws.amazon.com/blogs/compute/using-amazon-rds-proxy-with-aws-lambda/>

NEW QUESTION # 100

A company runs an application on an Amazon EC2 instance. A SysOps administrator creates an Auto Scaling group and an Application Load Balancer (ALB) to handle an increase in demand.

However, the EC2 instances are failing the health check.

What should the SysOps administrator do to troubleshoot this issue?

- A. Verify that the Auto Scaling group is configured to use all AWS Regions.
- B. Verify the maximum number of instances in the Auto Scaling group. Change the number if necessary.
- C. Verify the listener priority in the ALB. Change the priority if necessary.
- **D. Verify that the application is running on the protocol and the port that the listener is expecting.**

Answer: D

Explanation:

Target.FailedHealthChecks

Verify that the target is listening for traffic on the health check port. You can use the ss command on Linux targets to verify which ports your server is listening on. For Windows targets, you can use the netstat command.

<https://aws.amazon.com/premiumsupport/knowledge-center/elb-fix-failing-health-checks-alb/>

NEW QUESTION # 101

A company monitors its account activity using AWS CloudTrail, and is concerned that some log files are being tampered with after the logs have been delivered to the account's Amazon S3 bucket.

Moving forward, how can the SysOps administrator confirm that the log files have not been modified after being delivered to the S3 bucket?

- **A. Enable log file integrity validation and use digest files to verify the hash value of the log file.**
- B. Stream the CloudTrail logs to Amazon CloudWatch Logs to store logs at a secondary location.
- C. Enable S3 server access logging to track requests made to the log bucket for security audits.
- D. Replicate the S3 log bucket across regions, and encrypt log files with S3 managed keys.

Answer: A

Explanation:

When you enable log file integrity validation, CloudTrail creates a hash for every log file that it delivers. Every hour, CloudTrail also creates and delivers a file that Reference the log files for the last hour and contains a hash of each. This file is called a digest file.

CloudTrail signs each digest file using the private key of a public and private key pair. After delivery, you can use the public key to validate the digest file. CloudTrail uses different key pairs for each AWS region

<https://docs.aws.amazon.com/awscloudtrail/latest/userguide/cloudtrail-log-file-validation-intro.html>
