Latest SPLK-1002 Learning Material, Reliable SPLK-1002 Test Pattern

It is quite convenient to study with our SPLK-1002 study materials. If you are used to study with paper-based materials you can choose the PDF version which is convenient for you to print. If you would like to get the mock test before the real SPLK-1002 exam you can choose the software version, and if you want to study in anywhere at any time then our online APP version is your best choice since you can download it in any electronic devices. And the price of our SPLK-1002 learning guide is favorable.

Splunk Core Certified Power User Exam Sample Questions (Q65-Q70):

NEW QUESTION # 65
Which of the following can be used with the eval command tostring function (select all that apply)

- A. "duration"
- B. "Decimal"
- C. "commas"
- D. "hex"

Answer: A,C,D

Explanation:

NEW QUESTION # 66
When using | timechart by host, which field is represented in the x-axis?

- A. time
- B. host
- C. _time
- D. date

Answer: C

NEW QUESTION # 67
Data model fields can be added using the Auto-Extracted method. Which of the following statements describe Auto-Extracted fields? (select all that apply)

- A. Auto-Extracted fields can have their data type changed.
- B. Auto-Extracted fields can be added if they already exist in the dataset with constraints.
- C. Auto-Extracted fields can be given a friendly name for use in Pivot.
- D. Auto-Extracted fields can be hidden in Pivot.

Answer: A,B,C,D

Explanation:
Data model fields are fields that describe the attributes of a dataset in a data model2. Data model fields can be added using various methods such as Auto-Extracted, Evaluated or Lookup2. Auto-Extracted fields are fields that are automatically extracted from your raw data using various techniques such as regular expressions, delimiters or key-value pairs2. Auto-Extracted fields can be hidden in Pivot, which means that you can choose whether to display them or not in the Pivot interface2. Therefore, option A is correct. Auto-Extracted fields can have their data type changed, which means that you can specify whether they are strings, numbers, booleans or timestamps2. Therefore, option B is correct. Auto-Extracted fields can be given a friendly name for use in Pivot, which means that you can assign an alternative name to them that is more descriptive or user-friendly than the original field name2. Therefore, option C is correct. Auto-Extracted fields can be added if they already exist in the dataset with constraints, which means that you can include them in your data model even if they are already extracted from your raw data by applying filters or constraints to limit the scope of your dataset2. Therefore, option D is correct.

NEW QUESTION # 68
A calculated field maybe based on which of the following?

- A. Extracted fields
- B. Regular expressions
- C. Fields generated within a search string
- D. Lookup tables

Answer: A

Explanation:

As mentioned before, a calculated field is a field that you create based on the value of another field or fields2. A calculated field can be based on extracted fields, which are fields that are extracted from your raw data using various methods such as regular expressions, delimiters or key-value pairs2. Therefore, option B is correct, while options A, C and D are incorrect because they are not types of fields that a calculated field can be based on.

NEW QUESTION # 69
Which syntax will find events where the values for the 1 field match the values for the Renewal-MonthYear field?

- A. | where 10yearAnnerversary=Renewal-MonthYear
- B. | where '10yearAnnerversary'='Renewal-MonthYear'
- C. | where '10yearAnnerversary=Renewal-MonthYear
- D. | where 10yearAnnerversary='Renewal-MonthYear'

Answer: A

Explanation:
Explanation
The correct answer is A. | where 10yearAnnerversary=Renewal-MonthYear.
The where command is used to filter the search results based on an expression that evaluates to true or false.
The where command can compare two fields, two values, or a field and a value. The where command can also use functions, operators, and wildcards to create complex expressions1.
The syntax for the where command is:
| where <expression>
The expression can be a comparison, a calculation, a logical operation, or a combination of these. The expression must evaluate to true or false for each event.
To compare two fields with the where command, you need to use the field names without any quotation marks. For example, if you want to find events where the values for the 10yearAnnerversary field match the values for the Renewal-MonthYear field, you can use the following syntax:
| where 10yearAnnerversary=Renewal-MonthYear
This will return only the events where the two fields have the same value.
The other options are not correct because they use quotation marks around the field names, which will cause the where command to interpret them as string values instead of field names. For example, if you use:
| where '10yearAnnerversary'='Renewal-MonthYear'
This will return no events because there are no events where the string value '10yearAnnerversary' is equal to the string value 'Renewal-MonthYear'.
