Splunk Detail SPLK-4001 Explanation: Splunk O11y Cloud Certified Metrics User - PassTorrent Fast Download

We learned that a majority of the candidates for the SPLK-4001 exam are office workers or students who are occupied with a lot of things, and do not have plenty of time to prepare for the SPLK-4001 exam. Taking this into consideration, we have tried to improve the quality of our SPLK-4001 Training Materials for all our worth. Now, I am proud to tell you that our SPLK-4001 study dumps are definitely the best choice for those who have been yearning for success but without enough time to put into it.

Splunk SPLK-4001 Certification Exam covers a wide range of topics, including the basics of metrics data, the use of Splunk to collect and analyze metrics data, and the use of advanced features and tools to monitor and troubleshoot metrics data. Candidates who successfully pass this certification exam will be able to demonstrate their ability to use Splunk to monitor and analyze metrics data in a cloud environment, and will be recognized as experts in their field. Splunk O11y Cloud Certified Metrics User certification is highly sought after by employers in the IT industry, and is a valuable asset for IT professionals looking to advance their careers.

Get Success in Splunk SPLK-4001 Exam With an Unbelievable Score

Some candidates may be afaind of the difficult questions in the SPLK-4001 study materials for they are hard to be understood and memorized. But if you want to pass the exam perfectly, then you have to pay more attention on them. You must cultivate the good habit of reviewing the difficult parts of our SPLK-4001 Practice Guide, which directly influences your passing rate. What is more, our experts never stop researching the questions of the real SPLK-4001 exam. So our SPLK-4001 exam questons are always the latest for you to download.

Splunk O11y Cloud Certified Metrics User Sample Questions (Q57-Q62):

NEW QUESTION # 57
A Software Engineer is troubleshooting an issue with memory utilization in their application. They released a new canary version to production and now want to determine if the average memory usage is lower for requests with the 'canary' version dimension. They've already opened the graph of memory utilization for their service.
How does the engineer see if the new release lowered average memory utilization?

- A. On the chart for plot A, select Add Analytics, then select MeanrTransformation. In the window that appears, select 'version' from the Group By field.
- B. On the chart for plot A, click the Compare Means button. In the window that appears, type 'version1.
- C. On the chart for plot A, select Add Analytics, then select Mean:Aggregation. In the window that appears, select 'version'

from the Group By field.
- D. On the chart for plot A, scroll to the end and click Enter Function, then enter 'A/B-l'.

Answer: C

Explanation:
Explanation
The correct answer is C. On the chart for plot A, select Add Analytics, then select Mean:Aggregation. In the window that appears, select 'version' from the Group By field.
This will create a new plot B that shows the average memory utilization for each version of the application.
The engineer can then compare the values of plot B for the 'canary' and 'stable' versions to see if there is a significant difference.
To learn more about how to use analytics functions in Splunk Observability Cloud, you can refer to this documentation1.

NEW QUESTION # 58
A customer is experiencing issues getting metrics from a new receiver they have configured in the OpenTelemetry Collector. How would the customer go about troubleshooting further with the logging exporter?

- A. Adding logging into the metrics receiver pipeline:

```
metrics:
  receivers: [hostmetrics, otlp, signalfx, smartagent/signalfx-forwarder, logging]
  processors: [memory_limiter, batch, resourcedetection]
  exporters: [signalfx]
```

- B. Adding logging into the metrics exporter pipeline:

```
metrics:
  receivers: [hostmetrics, otlp, signalfx, smartagent/signalfx-forwarder]
  processors: [memory_limiter, batch, resourcedetection]
  exporters: [signalfx, logging]
```

- C. Adding debug into the metrics receiver pipeline:

```
metrics:
  receivers: [hostmetrics, otlp, signalfx, smartagent/signalfx-forwarder, debug]
  processors: [memory_limiter, batch, resourcedetection]
  exporters: [signalfx]
```

- D. Adding debug into the metrics exporter pipeline:

```
metrics:
  receivers: [hostmetrics, otlp, signalfx, smartagent/signalfx-forwarder]
  processors: [memory_limiter, batch, resourcedetection]
  exporters: [signalfx, debug]
```

Answer: A

Explanation:
The correct answer is B. Adding logging into the metrics receiver pipeline.
The logging exporter is a component that allows the OpenTelemetry Collector to send traces, metrics, and logs directly to the console. It can be used to diagnose and troubleshoot issues with telemetry received and processed by the Collector, or to obtain samples for other purposes1 To activate the logging exporter, you need to add it to the pipeline that you want to diagnose. In this case, since you are experiencing issues with a new receiver for metrics, you need to add the logging exporter to the metrics receiver pipeline. This will create a new plot that shows the metrics received by the Collector and any errors or warnings that might occur1
The image that you have sent with your question shows how to add the logging exporter to the metrics receiver pipeline. You can see that the exporters section of the metrics pipeline includes logging as one of the options. This means that the metrics received by any of the receivers listed in the receivers section will be sent to the logging exporter as well as to any other exporters listed2 To learn more about how to use the logging exporter in Splunk Observability Cloud, you can refer to this documentation1.
1: https://docs.splunk.com/Observability/gdi/opentelemetry/components/logging-exporter.html 2: https://docs.splunk.com/Observability/gdi/opentelemetry/exposed-endpoints.html

NEW QUESTION # 59

With exceptions for transformations or timeshifts, at what resolution do detectors operate?

- A. Native resolution
- B. The resolution of the chart
- C. The resolution of the dashboard
- D. 10 seconds

Answer: A

Explanation:
According to the Splunk Observability Cloud documentation1, detectors operate at the native resolution of the metric or dimension that they monitor, with some exceptions for transformations or timeshifts. The native resolution is the frequency at which the data points are reported by the source. For example, if a metric is reported every 10 seconds, the detector will evaluate the metric every 10 seconds. The native resolution ensures that the detector uses the most granular and accurate data available for alerting.

NEW QUESTION # 60
Which of the following statements about adding properties to MTS are true? (select all that apply)

- A. Properties can be set in the UI under Metric Metadata.
- B. Properties are sent in with datapoints.
- C. Properties are applied to dimension key:value pairs and propagated to all MTS with that dimension
- D. Properties can be set via the API.

Answer: A,D

Explanation:
Explanation
According to the web search results, properties are key-value pairs that you can assign to dimensions of existing metric time series (MTS) in Splunk Observability Cloud1. Properties provide additional context and information about the metrics, such as the environment, role, or owner of the dimension. For example, you can add the property use: QA to the host dimension of your metrics to indicate that the host that is sending the data is used for QA.
To add properties to MTS, you can use either the API or the UI. The API allows you to programmatically create, update, delete, and list properties for dimensions using HTTP requests2. The UI allows you to interactively create, edit, and delete properties for dimensions using the Metric Metadata page under Settings3.
Therefore, option A and D are correct.

NEW QUESTION # 61
What Pod conditions does the Analyzer panel in Kubernetes Navigator monitor? (select all that apply)

- A. Failed
- B. Not Scheduled
- C. Pending
- D. Unknown

Answer: A,B,C,D

Explanation:
The Pod conditions that the Analyzer panel in Kubernetes Navigator monitors are:
Not Scheduled: This condition indicates that the Pod has not been assigned to a Node yet. This could be due to insufficient resources, node affinity, or other scheduling constraints1 Unknown: This condition indicates that the Pod status could not be obtained or is not known by the system. This could be due to communication errors, node failures, or other unexpected situations1 Failed: This condition indicates that the Pod has terminated in a failure state. This could be due to errors in the application code, container configuration, or external factors1 Pending: This condition indicates that the Pod has been accepted by the system, but one or more of its containers has not been created or started yet. This could be due to image pulling, volume mounting, or network issues1 Therefore, the correct answer is A, B, C, and D.
To learn more about how to use the Analyzer panel in Kubernetes Navigator, you can refer to this documentation2.
